IELTS ACADEMIC · STUDENT WORKSHEET

# IELTS Academic Set 25

## All sections

Name: _____ Date: _____

**HOW TO USE THIS WORKSHEET**

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

# Listening

Use the separately supplied audio. Write one response for each question.

You will hear four recordings. You will hear each recording once only.

A separate two-minute computer check follows the recording.

## Part 1

## Questions 1-6

Complete the booking form. Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

**1.** Address: 46 _____ Road

**2.** Type of home: a _____

**3.** Room with the clearest draught: upstairs _____

**4.** Pressure test: _____ test

**5.** Proof of permission: landlord’s _____

**6.** Report sent within: _____

## Questions 7-10

Choose the correct letter, A, B or C.

**7.** Which appointment does Maren book?

**A** Tuesday at 4:00

**B** Thursday at 9:30

**C** Saturday at 11:00

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

**8.** Why does Jonah say a morning survey is useful?

**A** The assessor has more equipment available.

**B** The indoor-outdoor temperature difference is usually stronger.

**C** The landlord can attend at that time.

**9.** What preparation does Jonah ask Maren to make?

**A** Turn off the heating.

**B** Close all ordinary vents.

**C** Move large furniture away from exterior walls.

**10.** How will Maren pay for the survey?

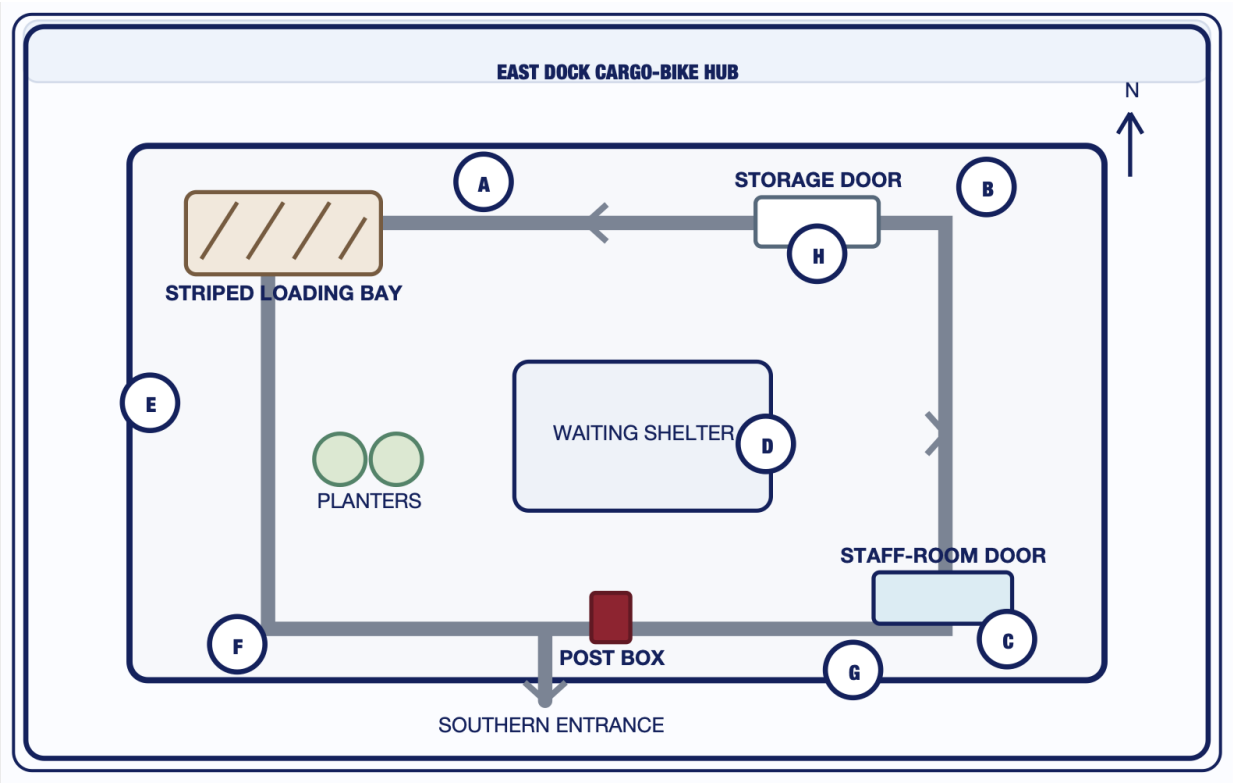

**A** Online after the visit

**B** By card when booking

**C** In cash before the survey

## Part 2

### Candidate map / plan

## Questions 11-14

Choose the correct rule, A-F, for each service area.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

**11.** What rule applies at the check-in desk?

- **A** Weigh the cargo before loading it.
- **B** Show the booking code.
- **C** Leave a bank card as security.
- **D** Begin with the demonstration doll.
- **E** Ask staff to access this area.
- **F** Bring your own tools.

**12.** What rule applies at the battery locker?

**13.** What rule applies at the loading bay?

**14.** What rule applies at the child-seat station?

## Questions 15-20

Label the courtyard plan. Choose the correct letter, A-H.

**15.** Which location marks the first-aid cabinet?

- **A** Location A on the courtyard plan
- **B** Location B on the courtyard plan
- **C** Location C on the courtyard plan
- **D** Location D on the courtyard plan
- **E** Location E on the courtyard plan
- **F** Location F on the courtyard plan
- **G** Location G on the courtyard plan
- **H** Location H on the courtyard plan

**16.** Which location marks the rainwater tap?

**17.** Which location marks the repair stand?

**18.** Which location marks the helmet rack?

**19.** Which location marks the battery-return hatch?

**20.** Which location marks the exit gate?

## Part 3

## Questions 21-25

Choose the correct response, A-G, for each handover problem.

**© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com**
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

**21.** Choose the agreed response when the allergy field is blank.

- **A** Record both values and escalate before merging the lists.
- **B** Use the most recent value without further action.
- **C** Ask a structured question in the simulated interview.
- **D** Pause and request the missing source from the facilitator.
- **E** Mark the item as not applicable.
- **F** Request a clearer source instead of inferring the name.
- **G** Check the active ingredient before classifying a duplication.

**22.** Choose the agreed response when the two different doses are recorded.

**23.** Choose the agreed response when the medicine name is partly illegible.

**24.** Choose the agreed response when the non-prescription products are absent.

**25.** Choose the agreed response when the brand and generic names may duplicate one medicine.

## Questions 26-30

Choose the correct letter, A, B or C.

**26.** What do the trainees agree should be their first action?

- **A** Arrange the medicine list by length
- **B** Confirm the simulated patient's identity
- **C** Correct the most obvious dose

**27.** How will they improve the escalation log?

- **A** Add colour coding only
- **B** Replace all comments with screenshots
- **C** Record an owner, initials and a time for each entry

**28.** How will they divide the interview work?

- **A** Alternate the lead after each case
- **B** Let one trainee lead all five cases
- **C** Ask the facilitator to conduct the interviews

**29.** What will be the main focus of their debrief?

- **A** The total number of mistakes
- **B** The reasoning behind their decisions
- **C** The speed of each interview

**30.** What evidence will they retain?

- **A** Only the final reconciled list
- **B** Photographs of the training room
- **C** An audit trail linking sources, discrepancies and actions

## Part 4

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

## Questions 31-36

Complete the sentences. Write ONE WORD ONLY for each answer.

**31.** Seeds can remain in a _____ seed bank above the ground.

**32.** In many fruits, valves are held shut by _____.

**33.** A strong heat pulse causes this material to _____.

**34.** Fire may create more _____ ground around the parent plant.

**35.** Ash may return _____ to the upper soil.

**36.** Frequent fires may occur before young plants reach _____.

## Questions 37-40

Answer the questions. Write NO MORE THAN TWO WORDS for each answer.

**37.** Which moving-air factor is excluded from a laboratory oven?

**38.** What provides stronger evidence than one method alone?

**39.** What structures require reproductive investment?

**40.** What repeated field evidence is needed after seasonal stress?

**© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com**
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

# Reading

Read the three passages and answer Questions 1-40. You have 60 minutes, including checking time.

Original unofficial IELTS Academic practice material aligned to the public format; it is not an official IELTS test.

## Cold Kept Underground

**A** Before mechanical refrigeration, keeping ice through summer was less a problem of making cold than of slowing the arrival of heat. A store had to hold a material that was moving towards the temperature of its surroundings. Thick walls alone could not solve every difficulty. Warm air travelled through doors, moisture weakened insulation, and meltwater could transfer heat back to the remaining blocks. The most successful ice houses therefore worked as systems in which location, shape, packing, access and drainage supported one another. Their design reveals how builders balanced the opposing demands of preservation and practical use.

**B** At Downhill, the ice house was built into sloping ground, using the site to shelter the chamber. Its passage led to a doorway, and the surviving description notes that a second door may once have stood within the passage. The chamber narrowed towards its base and incorporated a drain or sump, details that helped separate stored ice from meltwater. Pond ice was packed inside and insulated with straw. The record describes the structure as a combined ice house and dovecote, built in the late eighteenth century. It documents this individual estate example rather than a general rule for other nearby sites in Britain.

**C** The supply was usually gathered during winter. Workers cut ice from ponds or collected compacted snow where the climate allowed it, then transported the load quickly to the store. Inside, pieces were broken and pressed together so that large air gaps disappeared. Straw could be placed around the mass and between it and the walls, limiting contact with warmer surfaces. The process was labour intensive, and a mild winter could reduce the harvest. Because the material gradually melted even in a well-made house, managers often filled more space than later consumption required. The reserve served kitchens, medical care and the preservation of food.

**D** A typical chamber narrowed towards its base and was enclosed by several barriers. Brick or stone provided strength, while cavities or dry packing reduced heat transfer. Above, a vaulted roof carried the soil mound and kept the storage space dark. Access rarely led straight from outdoors to the ice. A passage and two doors created an air lock, so that one barrier could remain closed while a person entered through the other. The doorways were often small, and some stores were loaded from an upper opening. These inconveniences were purposeful: every wide opening created a route by which warm summer air could replace the cooler air inside.

**E** Drainage was as important as insulation. Water at the bottom of the chamber had to leave through a drain or sump without allowing a steady current of outside air to return along the same route. If meltwater remained, it surrounded the stored mass with liquid that could carry heat efficiently and encouraged damage to masonry. A floor that sloped towards an outlet helped separate the surviving ice from the water it had already lost. Designers sometimes included a trap or narrow channel to limit airflow. The detail was modest, but its failure could undermine the expensive walls and careful packing above it.

**F** The estate ice house was not the only form. Growing cities created a commercial trade in natural ice, and urban stores could be much larger. At the London site now associated with the Canal Museum, deep wells held imported ice delivered by ships from Norway for city customers. Scale altered the organisation of labour and distribution, but not the central physics: a compact mass, insulation, restricted access and managed drainage reduced loss. Commercial operators also had to move stock regularly, so circulation routes could not be reduced indefinitely. The building became a compromise between minimum exposure and the speed required to supply customers.

**G** Many surviving structures are puzzling when seen without their former setting. A brick-lined pit may have lost its doors, roof covering or drain, while an urban well can be hidden beneath later construction. Archaeological and estate records help identify how the parts once connected. They also warn against treating every round underground chamber as an ice house: evidence of access, water removal and association with a residence or trade strengthens the interpretation. What remains is therefore both a technical object and a record of seasonal work. Its value lies not in a single ingenious feature, but in the coordinated control of heat, air and water.

## Questions 1-7

Choose the correct heading for each paragraph, A-G, from the list of headings below. Write the correct number, i-viii, in boxes 1-7.

| | |
|---|---|
| **i** | Why water had to leave |
| **ii** | How ice was collected and packed |
| **iii** | The problem created by two competing demands |
| **iv** | What survives and what records reveal |
| **v** | From private estate to commercial scale |
| **vi** | Using location as part of the cooling system |
| **vii** | A sequence of barriers against heat |
| **viii** | Materials that distinguished urban and rural stores |

**1.** Paragraph A

**2.** Paragraph B

**3.** Paragraph C

**4.** Paragraph D

**5.** Paragraph E

**6.** Paragraph F

**7.** Paragraph G

## Questions 8-13

Complete the sentences below. Choose NO MORE THAN TWO WORDS from the passage for each answer.

**8.** The Downhill ice house was built into ____.

**9.** In winter, much of the ice placed in country stores was cut from ____.

**10.** Workers used ____ around the stored mass to reduce contact with warmer surfaces.

**11.** A passage with two doors formed an ____ at the entrance.

**12.** Water could be directed away through a drain or a ____.

**13.** Imported ice held in London's deep wells was delivered by ____ from Norway.

## Reading the Pavement by Touch

**A** Tactile paving is a system of raised surface patterns intended to communicate through the feet or a long cane. Its usefulness depends on a shared vocabulary. A change underfoot should indicate a particular condition, not merely decorate the pavement. Public guidance therefore distinguishes warning surfaces from directional ones and specifies where each should begin and end. Consistency matters because a pedestrian may encounter the same pattern in an unfamiliar town. Yet a technical drawing cannot guarantee an identical experience for every user. Footwear, cane technique, previous training, traffic noise and the condition of the paving all influence what can be detected and how quickly its meaning is understood.

**B** At a pedestrian crossing, a blister pattern can warn that the footway is ending where there may be no continuous kerb to mark the boundary. Guidance combines this tactile cue with careful placement and, where practicable, visual contrast. The colour is not treated as a substitute for the raised pattern, because some users rely on touch and some have limited rather

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

than no sight. The layout must also distinguish controlled from uncontrolled crossings without forcing the pedestrian towards moving traffic. A surface that is correctly manufactured but positioned at the wrong edge communicates confidently in the wrong place. This is why placement is part of the message rather than a finishing detail.

**C** Research on tactile-foot stimulation helps explain both the promise and the limits of such cues. Experiments show that information delivered through the sole can assist navigation, but performance depends on the pattern, the task and the participant. Laboratory studies can isolate detection from street noise, time pressure and divided attention; field observation captures those complications but makes causes harder to separate. Neither approach alone establishes that all patterns are equally easy to recognise. The strongest evidence comes from comparing methods and asking whether a measured difference would matter during an actual journey. Researchers also need enough varied participants before drawing conclusions about a population with diverse sensory experience.

**D** Directional ribs are designed to guide movement along a route, especially where ordinary boundaries such as a building line or kerb are absent. Their orientation is therefore part of the message. If ribs point towards an obstruction, fade into another surface or cross a warning pattern ambiguously, a detectable cue may still mislead. The problem becomes sharper in shared streets, where designers sometimes remove conventional kerbs to create a visually continuous space. What appears open and calm to a sighted planner may provide fewer reliable edges to a cane user. Reduced vehicle speed can be beneficial, but it does not eliminate the need for legible pedestrian information. Continuity matters because one reliable cue may lead directly into a section that provides none.

**E** Interpretation is also learned. A traveller familiar with one national system may not immediately understand a pattern assigned a different meaning elsewhere. Within one city, inconsistent use can have a similar effect. Training can improve recognition, yet it is unreasonable to make safe movement depend on specialist instruction that visitors have not received. Designers should instead preserve a limited set of distinct messages and avoid using the same texture for landscaping. Consultation adds another layer of evidence: users can explain where a cue feels clear, while observation may reveal hesitation that an interview alone misses. Familiarity can aid speed, but predictable design reduces the amount of familiarity a journey demands.

**F** Performance changes after installation. Raised blisters and ribs can wear down, become obscured by repair material or be interrupted by street furniture. Poor drainage may leave water or debris over the pattern, and temporary works may redirect pedestrians without extending the tactile route. These are not cosmetic defects. They can reduce contrast, weaken cane feedback or break the sequence on which interpretation relies. Maintenance records should consequently identify tactile surfaces as functional assets, not ordinary paving. Inspection is most useful when it checks the continuity and meaning of a route rather than counting isolated slabs. Repair teams must understand that replacing a slab can change a route's intended message.

**G** A sound assessment begins with the journey, not the product catalogue. It traces where a pedestrian receives advance warning, chooses a direction, crosses a vehicle path and finds the next dependable boundary. Technical compliance remains necessary, but designers should test whether separate elements form a coherent chain. This requires early involvement from people with different visual impairments, followed by field checking and scheduled maintenance. Evidence does not support a claim that tactile paving removes every hazard. It supports a narrower conclusion: standardised, well-placed and maintained cues can increase usable information, whereas inconsistent signals may create confidence without dependable guidance. This systems view turns separate specifications into an assessment of usable information.

## Questions 14-20

Do the following statements agree with the information given in Reading Passage 2? Write TRUE if the statement agrees, FALSE if it contradicts the passage, or NOT GIVEN if there is no information on this.

**14.** Official guidance distinguishes raised patterns by appearance but not by the message they carry.

**15.** A blister pattern may warn pedestrians where a footway meets a crossing without a continuous kerb.

**16.** Visual contrast is presented as an adequate substitute for the raised pattern.

**17.** The study participants had received mobility training before the experiments.

**18.** Directional ribs can become misleading when their orientation is wrong.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

**19.** Reduced vehicle speed is presented as a reason to omit legible pedestrian cues in shared streets.

**20.** Maintenance records for tactile routes are normally updated after surface repairs.

## Questions 21-26

Which paragraph contains the following information? Choose the correct letter, A-G. You may use any letter more than once.

**21.** a reason why a tactile message should remain recognisable in different places

**22.** examples of damage or obstruction that can weaken an installed route

**23.** a warning that visitors may not know a locally used meaning

**24.** a comparison of what laboratory and street research can reveal

**25.** an explanation of why removing familiar street edges can create uncertainty

**26.** a recommendation to assess a connected journey rather than isolated products

## Can a Community Govern Data Collectively?

**A** Local authorities, researchers and charities increasingly combine data to plan services. The attraction is clear: information collected for transport, housing or health may reveal needs that no single institution can see. The difficulty is that a technically useful link can still be socially unacceptable. Calling the arrangement a data trust does not settle that problem. The term is used for several legal and organisational forms, and a label cannot create accountability by itself. A credible initiative must begin with a defined public purpose, identify the people who may be affected and explain why shared governance is preferable to an ordinary contract. Structure should follow the problem rather than supply it with an impressive name.

**B** Community involvement is often promised through an advisory panel, but advice without influence can become ceremonial. Representatives need a clear route into decisions about access, acceptable uses and the distribution of benefits. Selection also matters. The residents easiest to recruit may already be comfortable with institutions, while people most exposed to surveillance or exclusion remain absent. Perfect representation is impossible, but the trust can publish who participates, which interests are missing and how disagreement changes a proposal. This treats legitimacy as an ongoing practice rather than a meeting held before launch. It also gives technical specialists information about harms that are invisible in a data schema.

**C** Stewards sit between the data holders and those seeking access. Their duty is not simply to maximise the number of projects approved. They must interpret the trust's purpose, test requests against agreed rules and refuse uses that are incompatible with them. Some commentators compare this role with fiduciary responsibility, but existing initiatives operate under varied legal vehicles and the exact obligations differ by jurisdiction. What matters operationally is that stewards have authority, relevant expertise and protection from pressure by the organisations supplying money or data. Without those conditions, review risks becoming a polite description of decisions made elsewhere.

**D** Consent presents a deeper challenge. Individual permission is important when it is feasible, yet a one-time agreement cannot anticipate every future linkage or inference. Conversely, treating community approval as permission to ignore individual rights would replace one weakness with another. Collective consent is meaningful only if the group can revisit conditions, withdraw support from a class of uses and see what has occurred. The trust therefore needs procedures for renewal, not a permanent licence obtained at the start. It should also distinguish between permission to hold information, permission to analyse it and permission to act on the resulting classification.

**E** Good governance reduces the amount of faith placed in good intentions. Data minimisation limits what is collected or retained, which narrows the damage possible after misuse or a security failure. Access controls determine who can work with which fields and under what conditions. An audit trail records requests, decisions and subsequent activity, allowing patterns to be examined later. These mechanisms serve different audiences: engineers need operational detail, while the public needs an intelligible account of purposes, recipients and outcomes. Publishing every technical log would overwhelm rather than inform. Transparency requires selection and explanation, not indiscriminate disclosure.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

**F** Disagreement must have somewhere to go. If the same team designs a rule, applies it and judges complaints about it, procedural confidence will remain fragile even when its intentions are sound. An independent appeal or challenge function gives affected people a remedy beyond the original decision-maker. It can also reveal recurring weaknesses in criteria or communication. Independence need not mean isolation: the appeal body still needs access to records and relevant expertise. Nor should challenge begin only after visible harm. Periodic audits and published reasons can expose inconsistent decisions early and make the exercise of discretion easier to scrutinise.

**G** Commercial access is sometimes portrayed as inherently incompatible with community benefit. That conclusion is too simple. A company might provide a tool or analysis that advances the stated purpose, while a nominally public organisation might seek an intrusive use. The better test concerns purpose, proportionality, benefit, safeguards and enforceable conditions. Any revenue should be governed transparently, but payment does not determine legitimacy on its own. The trust must be able to reject an attractive offer when its use conflicts with the mandate. Equally, a blanket refusal could prevent a carefully constrained collaboration that the represented community values.

**H** Finally, evaluation should ask whether public value and meaningful control endure. Counting approved projects rewards activity, not quality. A fuller account would examine who obtained access, which requests were refused, whether affected groups could change conditions, how benefits were distributed and whether promised safeguards worked in practice. Measures must be revisited because both technology and community priorities change. A durable evaluation also records unintended consequences and the cost of participation, since a procedure may look inclusive while demanding time or expertise that only well-resourced groups possess, shaping which objections are heard locally. This is why a data trust should be understood less as a vault than as a constitutional arrangement: it allocates power, establishes procedures and makes decisions contestable. Its success lies not in eliminating conflict, which is unrealistic, but in handling conflict openly while keeping the original purpose within reach.

## Questions 27-33

Do the following statements agree with the views of the writer? Write YES if the statement agrees, NO if it contradicts the writer, or NOT GIVEN if it is impossible to say what the writer thinks.

**27.** The writer regards accountability as depending on more than the label given to a data-sharing arrangement.

**28.** An advisory panel can provide legitimate community involvement even when it has no influence over access decisions.

**29.** Stewards in established data trusts are generally appointed through public elections.

**30.** Collective consent should be open to revision as possible data uses develop.

**31.** For public transparency, the writer favours releasing technical records without further explanation.

**32.** A challenge process separate from the original decision-maker can strengthen legitimacy.

**33.** Commercial organisations are more likely than public bodies to produce socially valuable data projects.

## Questions 34-40

Complete each sentence with the correct ending, A-I, below.

**34.** The first stage in designing a credible data trust

**35.** Giving stewards authority to reject incompatible uses

**36.** A process for renewing collective consent

**37.** Data minimisation

**38.** Publishing reasons and reviewing audit records

**39.** An independent appeal mechanism

**40.** Long-term evaluation

# Writing

## Writing Task 1

- You should spend about 20 minutes on this task.
- Write at least 150 words.

The line graph below shows the number of resident and visitor passengers using a ferry service on a fictional island route from January to June.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

## Writing Task 2

- You should spend about 40 minutes on this task.
- Write about the following topic.
- Give reasons for your answer and include any relevant examples from your own knowledge or experience.
- Write at least 250 words.

Some people think that all new apartment buildings should be required to include shared indoor rooms for residents.

To what extent do you agree or disagree?

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

# Speaking

## Part 1

### Topic 1

Now, let's talk about waiting in queues.

- How often do you have to wait in a queue?
- In what situations do you dislike waiting in a queue most?
- What do you usually do while you are waiting?
- Has the way you feel about waiting changed since you were younger?

### Topic 2

Let's talk about boxes and containers.

- What kinds of boxes or containers, if any, do you keep?
- How do you decide whether to keep or discard a container?
- What practical uses can old boxes or containers have?
- Do you prefer containers with a simple design or a decorative one? Why?

### Topic 3

Now, let's talk about neighbourhood noticeboards.

- Where, if anywhere, do you notice public announcements near where you live?
- What information would you look for on a neighbourhood noticeboard?
- Is an online noticeboard more useful than a physical one? Why or why not?
- Will physical noticeboards still be useful in the future?

## Part 2

- Now I'm going to give you a topic, and I'd like you to talk about it for one to two minutes.
- You have one minute to prepare. You can make some notes if you wish.

### Describe a rule in a shared place that you think works well.

You should say:

- what the place is and what the rule says
- who is expected to follow the rule
- how the rule affects people's behaviour

and explain why you think the rule is effective or how it could be improved.

- Is the rule easy for visitors to understand?
- Would you change any part of the rule?

Thank you. Now we'll move on to Part 3.

## Part 3

We've been talking about a rule in a shared place. I'd now like to discuss rules for shared places more generally.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

- Why do shared places sometimes need rules that private places do not?
- What makes a rule seem fair to the people expected to follow it?
- Should the same rules apply to people of all ages in shared places?
- Can the design of a place influence behaviour more effectively than penalties? In what ways?
- How much influence should the public have when rules for shared places are created?
- How might rules for shared places change as cities become busier?

Thank you. That is the end of the Speaking test.
