IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 27

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

You will hear four recordings. You will hear each recording once only.

Answer all questions and follow the word limit printed above each group.

A separate two-minute computer check follows the recording.

Part 1

Questions 1-6

Complete the parcel declaration. Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

1. Destination country: _____

2. Main item: wool _____

3. Parcel weight: _____ kg

4. Declared value: NZ$ _____

5. Sender street: Aroha _____

6. Selected service: _____ Track

Questions 7-10

Choose the correct letter, A, B or C.

7. Which item must Moana remove from the parcel?

A the wooden puzzle

B the watercolour set

C the honey

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

8. Why did Moana think the removed item might be accepted?

A She had sent it within New Zealand.

B It was still in shop packaging.

C It had a low declared value.

9. How will the final parcel labels be produced?

A Moana will write them by hand.

B The counter printer will produce them.

C The recipient will email them later.

10. What does Callum say remains Moana's responsibility?

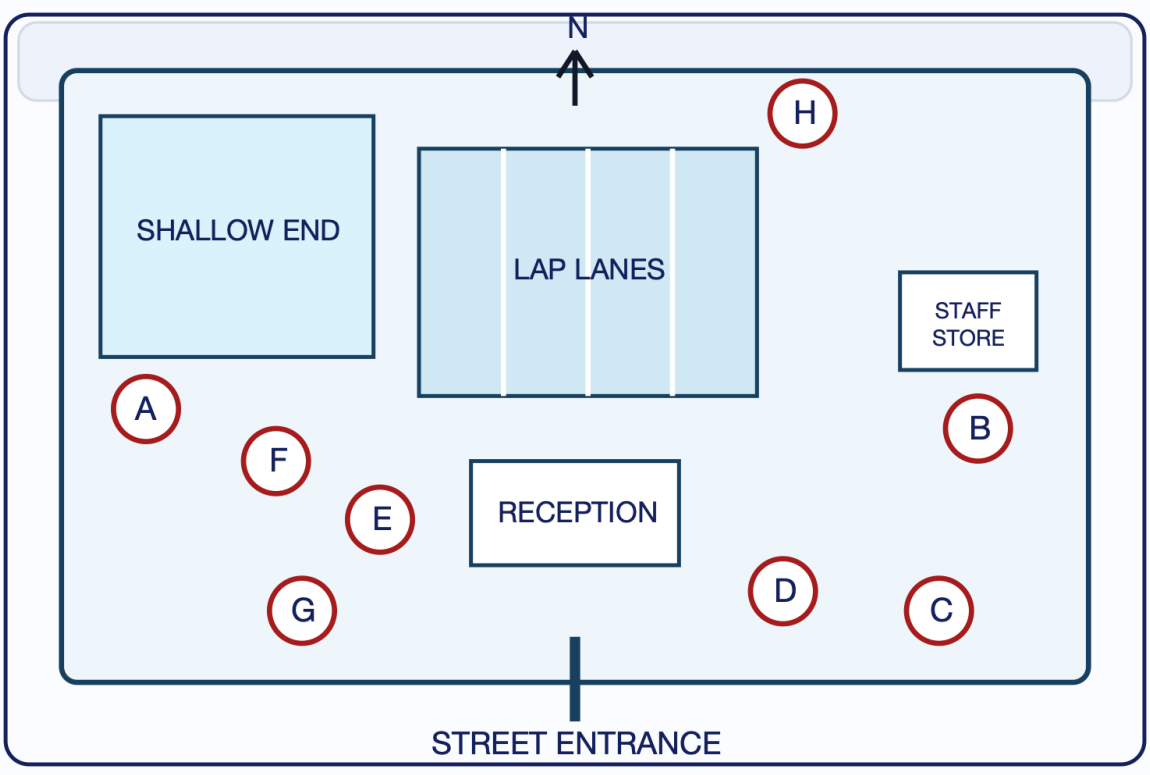

A Choosing the fastest service

B Keeping the parcel seams clear

C Giving an accurate contents statement

Part 2

Candidate map / plan

Questions 11-16

Label the plan. Choose the correct letter, A-H.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

11. Where is the changing room?

A

B

C

D

E

F

G

H

12. Where is the first-aid room?

13. Where is the accessible ramp?

14. Where is the tide gate?

15. Where is the family deck?

16. Where are the equipment racks?

Questions 17-20

Answer the questions. Write NO MORE THAN TWO WORDS for each answer.

17. What colour flag shows that a section is closed?

18. What should visitors read before using the northern path?

19. What should swimmers use when entering by the ramp?

20. What do children need if they enter outside a coached lesson?

Part 3

Questions 21-25

Choose the correct source, A-G, for each check.

21. Which source will the trainees use to check earliest online appearance?

A the original uploader

B a weather archive

C image metadata

D a street map

E a transport timetable

F a reverse-image search

G a hospital spokesperson

22. Which source will the trainees use to check camera time?

23. Which source will the trainees use to check weather at the claimed hour?

24. Which source will the trainees use to check fixed landmarks?

25. Which source will the trainees use to check first-hand context and permission?

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Questions 26-30

Choose the correct letter, A, B or C.

26. What does the reverse-image search reveal?

A The picture was first posted in Toronto today.

B The picture appeared online eighteen months earlier.

C The picture has never appeared on a public website.

27. What conclusion do they draw from the missing location metadata?

A The image does not establish its location.

B The location field was deliberately removed.

C The image must have been taken indoors.

28. What corrects Declan's first interpretation of the red vehicle?

A a passenger interview

B a route timetable

C the visible company logo

29. What do the trainees decide to do next?

A Publish the image with a shorter caption.

B Refer the publication decision to the editor.

C Ask the transit authority to identify the station.

30. Which statement best describes their verified finding?

A It is a generated image of an invented flood.

B It is a current image with an uncertain photographer.

C It is a genuine older image with a false time and place.

Part 4

Questions 31-36

Complete the sentences. Write ONE WORD ONLY for each answer.

31. Cryoconite begins with fine mineral _____ and organic particles.

32. A dark patch has lower _____ than clean bright ice.

33. As a hole forms, _____ collects around the particles.

34. Microbial substances help bind particles into _____.

35. In very cold settings, a lid of _____ may form above the water.

36. Material accidentally introduced during sampling is called _____.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Questions 37-40

Choose the correct letter, A, B or C.

37. Why can a dark patch deepen the ice beneath it?

A It absorbs more incoming energy.

B It prevents all water from draining.

C It increases the reflectiveness of the surface.

38. What does the lecturer say about a hole with an ice lid?

A It contains no living organisms.

B It is relatively closed but not permanently sealed.

C It cannot receive light from above.

39. Why are replicate samples valuable?

A They remove the need to record hole depth.

B They guarantee that tools remain sterile.

C They represent spatial variation better than one hole.

40. Which study design does the lecturer recommend?

A Biological sampling combined with physical and hydrological observations

B A single large sample from the darkest visible hole

C Surface photographs without disturbing any sediment

Reading

Read the three passages and answer Questions 1-40. You have 60 minutes, including checking time.

Original unofficial IELTS Academic practice material aligned to the public format; it is not an official IELTS test.

Building Together: How Birds Make a Nest

A A bird carrying a twig invites a familiar picture: a small architect executing an internal plan. Yet a completed nest can mislead observers about the process that produced it. The builder does not necessarily plan every detail first and then reproduce it. Actions are repeated, interrupted and revised as material bends, wind shifts or a partner changes the structure. Even where a species has a recognisable nest form, individuals vary in experience and local conditions. Researchers therefore treat construction as behaviour unfolding through time, not simply as an object to be measured at the end. The useful question is how a workable form emerges without a fixed blueprint.

B Material handling is one part of the process, but researchers must define what they see. In the Barcelona study, delivery of material collected away from a nest counted as building. Moving or manipulating material already within the same structure counted as maintenance. The observed birds carried mostly sticks, together with a smaller number of palm leaves and one recorded piece of grass. During maintenance, a bird might remove a stick and insert it in a new position, or manipulate it where it lay. These distinctions prevent every movement from being treated as a new contribution and make repeated observations comparable across birds and nests.

C When two or more birds attend the same nest, cooperation need not mean identical labour. In observed monk-parakeet groups, males performed more recorded construction and maintenance than females, while females invested more in defence. Several males sharing a breeding chamber often contributed, although their effort was uneven. This division should not be converted into a universal rule for all birds. It demonstrates a narrower point: a shared product can arise from complementary roles rather than equal turns. Coordination may consist of one bird delivering sticks while another guards, rearranges, or works elsewhere on the compound structure.

D The social scale becomes especially clear in compound nests. Sociable weavers build many chambers beneath communal thatch, and investment near a bird's own chamber can also benefit relatives occupying adjacent areas. Monk parakeets likewise place separate chambers within a larger mass of interlaced sticks. The outer structure can then function as a public good: no single chamber owner created every protective layer, but several occupants use it. This does not erase individual interests. Instead, it changes the unit of analysis. Researchers must examine both the chamber and the shared fabric if they are to understand who contributes and who gains.

E Shared fabric also creates opportunities for conflict. A stick already woven into one section may be taken and moved to another, behaviour researchers describe as theft of nesting material. Owners may respond with calls, chases or direct defence. In the Barcelona observations, most newly delivered items went to the carrier's own nest, while stealing and defensive encounters still occurred. Cooperation and competition are therefore not opposite labels from which one must be chosen. They can appear in the same colony, sometimes within minutes, because neighbours benefit from a stable compound while disputing particular resources and boundaries.

F Careful methods are essential because movement alone does not reveal purpose. Field researchers distinguish building, in which material arrives from elsewhere, from maintenance, in which an existing piece is shifted within the structure. They identify birds through individual marks, record the chamber attended, and distribute observations across different times. Even then, absence from a watch period is not proof that a bird never builds. Nor does a count of deliveries measure the difficulty or value of each item. Operational definitions make comparisons possible, but conclusions must remain proportionate to what was actually observed.

G The resulting view of nest building is dynamic. A structure accumulates through choices, failed insertions, repairs and responses to other occupants. Environmental feedback may make a bird repeat a successful action or abandon a material that behaved poorly. Social feedback may redirect effort towards defence or towards damage elsewhere in the nest. The final shape records these adjustments without displaying their sequence. For that reason, experiments and repeated observations are more informative than a single photograph. They reveal construction as a flexible negotiation between inherited tendencies, individual experience, physical materials and partners, rather than the mechanical execution of a

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

complete design. That sequence also helps explain why superficially similar nests can embody different histories of work and repair within a single breeding colony.

Questions 1-7

Choose the correct heading for each paragraph, A-G, from the list of headings below. There are more headings than paragraphs, so you will not use them all.

i	Materials delivered and rearranged
ii	How observers define and record construction
iii	A communal structure as a collective resource
iv	Why the architect metaphor is incomplete
v	A seasonal journey to new nesting grounds
vi	Adjustment instead of a complete advance plan
vii	Unequal roles can still produce a shared result
viii	The case for one universal building sequence
ix	Competition within a cooperative setting

1. Paragraph A

2. Paragraph B

3. Paragraph C

4. Paragraph D

5. Paragraph E

6. Paragraph F

7. Paragraph G

Questions 8-14

Complete the summary below. Choose NO MORE THAN TWO WORDS from the passage for each answer.

8. Paragraph A's final sentence explains that a workable form can emerge without a 8 ____; write the complete two-word expression.

9. Most of the building material recorded in the study consisted of 9 ____.

10. In one parakeet study, females devoted relatively more effort to 10 ____.

11. In sociable-weaver nests, several chambers lie below a layer of 11 ____.

12. Researchers describe such movement as 'theft of 12 ____'; write the complete two-word term from the passage.

13. Researchers can recognise particular birds by using 13 ____.

14. Repeated observation shows how 14 ____ from a material may cause a bird to repeat an action or abandon that material.

Ropewalks: Factories Shaped by Their Product

A Before mechanised factories compressed production into compact floors, rope was made along an extended path. Fibres had to be drawn out and twisted over a distance related to the intended cordage. The word ropewalk came to describe both this method and the specialised place where it occurred. A worker could move backwards while paying out hemp, with separate strands later combined into larger rope. The product therefore imposed an unusual geometry on the workplace. Instead of arranging many short operations around a central power source, builders provided a remarkably long, narrow route along which tension and alignment could be maintained. The route was therefore part of the production apparatus itself.

B Length was not decorative. Historical ropewalks could extend for hundreds or even thousands of feet, and a building had to accommodate the rope being laid. Some operations used covered structures; others worked on open or partly sheltered walks. Local climate, investment and the value of continuous production influenced the choice, so surviving buildings should not be mistaken for a single universal type. Whatever the enclosure, the linear plan organised people, reels and moving strands. It also created practical difficulties: communication across distance, repeated walking, the movement of bulky fibre and the risk that one interruption would affect work along the whole line. Its proportions followed the work rather than a conventional room plan.

C The Charlestown Navy Yard in Boston opened its ropewalk in 1838. The building followed what is now Chelsea Street for 1,325 feet and could produce rope up to roughly a quarter of a mile long. Initially powered by steam, it incorporated innovations associated with Daniel Treadwell. Granite and brick construction made it notable as an early attempt at fireproofing. The government site became the Navy's largest ropemaking facility, but it did not supply every requirement. Private firms provided most naval rope, while the public factory could expand output in wartime and also test or develop products. Its public value lay partly in this combination of production and experimentation.

D That reserve role complicates a simple story of obsolete craft. Steamships still needed cordage even after sails ceased to dominate propulsion, and wartime demand could rise sharply. A battleship used rope for mooring, handling equipment and many routine operations. The Navy therefore valued a plant that retained specialised labour and machinery when private supply was slow to respond. After the Second World War, however, federal officials reconsidered which industries government should operate directly. Debate about closure concerned not only immediate output but the less visible value of testing capacity and technical knowledge. Keeping that capacity available was itself part of the institutional calculation.

E At Jones Point near Alexandria, Virginia, Josiah Davis built a different ropewalk in 1833. It was a narrow, two-storey structure about 400 yards long, serving the maritime trade of the nearby port. A later recollection described boys running through the abandoned building and playing on a large reel, evidence of an industrial space acquiring informal uses after production ended. During operation, a spinner walked backwards between reels, unwinding hemp carried around the waist and forming strands by hand. The work joined bodily movement to the building's length; one account suggests a spinner might walk 20 miles during a ten-hour day. Here too, the working method and the architecture were inseparable.

F Much of the Jones Point structure disappeared, so archaeology supplies evidence unavailable from standing architecture. Excavation exposed foundation remains and a black stain running along the centre. Investigators interpreted the stain as probably resulting from tar applied to cordage to resist decay in seawater. The mark is modest compared with an intact factory, yet it links a material trace to a production stage. Its interpretation also requires caution: the stain supports a probable explanation, not a complete reconstruction of every task, machine or worker who occupied the building. The evidence is strongest when trace, process and setting are considered together.

G Ropewalks matter because form, labour and product are unusually legible together. Their extreme length records a manufacturing constraint, while walls, power systems and fire precautions reflect local decisions about risk and investment. Documentary sources can identify dates, managers or output; surviving structures reveal spatial organisation; archaeology may recover residues after walls have gone. None is sufficient alone. Combined, they show how an apparently simple object depended on coordinated motion, specialised infrastructure and maritime markets. Preservation therefore protects evidence of an industrial system, not merely an eccentric long building. Reading the traces together also exposes what disappears with machinery, routine and spoken knowledge. Dimensions cannot recover workshop discipline, but they establish the physical scale within which it operated. In that way, an elongated shell becomes evidence about labour, supply, technology and institutional choice across changing institutions.

Questions 15-20

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Do the following statements agree with the information given in Passage 2? Write TRUE if the statement agrees, FALSE if it contradicts the passage, or NOT GIVEN if there is no information on this.

15. The term ropewalk referred only to the building and never to the manufacturing method.

16. Every historical ropewalk was completely enclosed by a roof and walls.

17. Private businesses supplied most of the rope required by the Navy.

18. The Charlestown ropewalk was steam-powered when it first opened.

19. The Jones Point ropewalk occupied a single floor.

20. Researchers linked a dark archaeological mark at Jones Point to tar used on rope.

Questions 21-26

Match each statement with the correct option, A-D. You may use any letter more than once.

21. was recorded as extending 1,325 feet

22. was constructed close to the port of Alexandria

23. left foundations and a central stain for archaeologists to examine

24. used granite and brick in an early fireproofing effort

25. could be hundreds or thousands of feet long because of the manufacturing process

26. later became an informal place for local children to play

Community Paramedicine: Extending Care or Rearranging Demand?

A Paramedics are usually imagined responding to unpredictable emergencies and transporting patients to hospital. Community paramedicine broadens that model. Some programmes schedule home visits, receive referrals from primary care or follow people who repeatedly call emergency services. During a visit, a practitioner may assess health, review medicines, provide education or connect a patient with another service. The purpose is not simply to replace an ambulance journey with a cheaper journey. It is to intervene earlier, improve access and decide which setting can meet a need safely. Because programmes differ, the label names a family of arrangements rather than one standard intervention. Designs therefore take different routes to earlier care.

B The diversity is substantial. A systematic review identified programmes serving frequent emergency callers, people at risk of hospital admission, older adults and other groups. Most described home visits, yet their services and training varied. Some retained a strong acute-care emphasis; others added prevention, screening, counselling or referral. Such variation may be useful because local gaps differ. It also obstructs simple comparison. If one evaluation measures emergency calls and another measures medication adherence, a combined claim about effectiveness can conceal unlike objectives. Before asking whether community paramedicine works, analysts must specify for whom, through which activities and against what alternative. Comparison must keep those intended endpoints visible.

C Referral pathways reveal the institutional change involved. A general practitioner may identify a patient suitable for a home visit, while a paramedic may discover needs requiring primary care, social support or urgent transport. Information must travel in both directions, and responsibility cannot remain vague when a condition worsens. Scope of practice therefore concerns more than a list of clinical procedures. It includes access to records, supervision, escalation rules and the authority to make or receive referrals. Programmes that add tasks without clarifying these boundaries may create another handoff rather than genuine continuity. Continuity also depends on that institutional wiring.

D Training presents a parallel problem. The systematic review found that many programme reports described training incompletely, and reported content ranged from acute assessment to communication, leadership and knowledge of community services. Existing paramedic education supplies relevant foundations, but planned care can require different habits from rapid emergency response. A home visit may expose medication routines, housing hazards or social isolation that cannot be addressed by a single technical intervention. A useful framework would identify core competencies while allowing additional preparation for the population and partners in each programme. Standardisation should establish a floor,

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

not erase local adaptation. Shared standards and local preparation serve different needs.

E Advocates often expect planned visits to reduce pressure on emergency departments. That outcome is plausible, but substitution must be demonstrated. A programme may reduce ambulance transport for enrolled patients while creating new appointments, referrals or follow-up work elsewhere. This additional activity can still be valuable if it meets neglected needs or prevents later harm. It simply means that success cannot be inferred from one falling count. Evaluators should trace changes across services and distinguish avoided emergency use from care that was shifted, delayed or newly provided. A broader service ledger distinguishes these possibilities.

F Early programme reports illustrate both promise and risk. One ambulance trust described teams integrated with local general practices, undertaking some home visits while continuing to answer emergency calls. Its annual report presented encouraging early figures from a particular pilot. Those observations can justify further testing, but they cannot establish that the same results will occur in every region. Participants were selected through local pathways, the comparison period was limited, and surrounding services mattered. Treating an operational report as universal proof would confuse evidence that a model can function with evidence about its average effect. The report remains informative within local context.

G System incentives also shape the model. Ambulance organisations are commonly measured through response and transport indicators, whereas planned prevention may produce benefits outside those categories or after a long delay. Funding tied only to emergency activity can therefore make successful prevention look like lost work. Conversely, paying for home visits alone can reward volume without showing benefit. Commissioners need measures connected to the programme's stated mechanism: access, safe treatment, patient experience, subsequent service use and appropriate escalation. They should also monitor unintended consequences, including missed deterioration, duplicated assessment and unequal enrolment. Balanced incentives need activity and outcome measures.

H The strongest case for community paramedicine is conditional. Paramedics can bring assessment skills and mobile access into homes, and may connect patients with services before a crisis. Yet an expanded role does not itself prove an outcome. A credible programme defines its target group, referral pathway, clinical boundaries, training and theory of change before selecting measures. Evaluation then asks whether care improved, replaced other activity or merely added to it, and whether gains were fair. This avoids treating every prevented journey as success or dismissing local innovation. Community paramedicine should be judged as a designed system, not as a job title with assumed effects. Evidence should follow the whole pathway so access gains can be distinguished from activity shifted between organisations, and local dependencies from mechanisms that may travel more reliably. It also keeps unenrolled patients and unmet needs visible.

Questions 27-33

Do the following statements agree with the views of the writer in Passage 3? Write YES if the statement agrees, NO if it contradicts the writer, or NOT GIVEN if there is no information about the writer's view.

27. The writer presents lower-cost transport to hospital as the principal aim of community paramedicine.

28. Variation between programmes may be useful because communities have different service gaps.

29. The writer treats scope of practice as extending beyond a catalogue of clinical procedures.

30. The systematic review found that most training programmes included a formal examination.

31. Additional activity can still be worthwhile when it addresses needs that were previously neglected.

32. The ambulance trust followed the reported pilot for exactly two years.

33. Paying providers according to the number of home visits is sufficient to demonstrate benefit.

Questions 34-40

Choose the correct letter, A, B, C or D.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

34. Which feature most clearly shows how community paramedicine broadens the conventional emergency-response model?

A It places medication review ahead of clinical assessment during home visits.

B It reserves hospital transport for patients already known to primary care.

C It combines scheduled visits and referrals with responses to recurring emergency use.

D It limits paramedic decisions to choosing the safest destination for care.

35. According to paragraph B, what should analysts establish before evaluating whether a programme works?

A Its target population, activities and relevant alternative

B The proportion of staff trained in medication counselling

C Whether home visits are more common than emergency calls

D Which outcome is easiest to combine across studies

36. What risk does paragraph C associate with adding tasks before institutional boundaries are clear?

A Primary care may take over urgent transport decisions.

B Access to patient records may become too widely shared.

C Social support may be sought before clinical needs are assessed.

D The programme may create an extra handoff instead of continuity.

37. What training approach does the writer favour?

A More community-service teaching within otherwise unchanged emergency training

B Core competencies combined with programme-specific preparation

C A common curriculum adjusted mainly to the provider’s prior experience

D Locally selected competencies supported by optional emergency foundations

38. How should early pilot results be treated?

A As an estimate of the model’s average effect in similar regions

B As a reason for further testing rather than universal proof

C As a basis for comparing ambulance trusts before further trials

D As evidence about which local service caused the reported change

39. Why should an evaluation keep unenrolled patients and unmet needs visible?

A To estimate emergency-call frequency outside the target group

B To calculate whether new appointments offset ambulance journeys

C To define clinical boundaries for people not offered home visits

D To avoid judging fairness only among programme participants

40. Which statement best summarises the writer's conclusion?

A Programmes should be judged through explicit design and system-wide evidence.

B Programme value depends chiefly on linking patients to services earlier.

C Comparable programmes should share one theory of change and one training model.

D System-wide measures should follow a local fall in ambulance transport.

Writing

Writing Task 1

- You should spend about 20 minutes on this task.
- Write at least 150 words.

The pie charts below show how unwanted household textiles in a fictional region were dealt with in 2012 and 2025.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Writing Task 2

- You should spend about 40 minutes on this task.
- Write about the following topic.
- Give reasons for your answer and include any relevant examples from your own knowledge or experience.
- Write at least 250 words.

Most civil court hearings should continue to be held online whenever the necessary technology is available.

To what extent do you agree or disagree?

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Speaking

Part 1

Topic 1

Let's talk about receipts.

- Do you usually keep receipts when you receive them?
- Do you find paper or digital receipts easier to manage?
- When might you need to check a receipt?
- Do you think you will keep receipts differently in the future?

Topic 2

Now, let's talk about using stairs.

- How often do you use stairs in places you visit?
- When both are available, do you prefer stairs or a lift?
- What makes a staircase easy or difficult to use?
- Has the way you use stairs changed over time?

Topic 3

Now, let's talk about short trips near where you live.

- What short trips, if any, do you make near where you live?
- How do you usually travel on a short local trip?
- Do you normally plan short trips or decide at the last moment?
- Do you think the way you make local trips will change?

Part 2

- Now I'm going to give you a topic, and I'd like you to talk about it for one to two minutes.
- You have one minute to prepare. You can make some notes if you wish.

Describe a promise you kept even though it was difficult.

You should say:

- what the promise was
- who you made it to
- what made it difficult to keep

and explain why keeping the promise mattered to you.

- Did anyone help you keep this promise?
- Would you make the same promise again?

Thank you. Now we'll move on to Part 3.

Part 3

We've been talking about keeping a promise. I'd now like to discuss commitments and trust more generally.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

- Why do people make promises to one another?
- How are promises made by organisations different from personal promises?
- What kinds of guarantees help people trust an organisation?
- When an organisation breaks a promise, which matters more: a penalty or damage to its reputation?
- Do expectations about keeping promises differ between communities or generations?
- How might people check whether organisations keep their promises in the future?

Thank you. That is the end of the Speaking test.
