IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 28

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

You will hear four recordings. You will hear each recording once only.

Answer all questions and follow the word limit printed above each group.

A separate computer answer-check period follows the recording.

Part 1

Questions 1-6

Complete the custom order form. Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

1. Width of print: _____ cm

2. Mount colour: _____

3. Frame timber: _____

4. Finish: _____

5. Glazing material: _____

6. Collection date: _____ May

Questions 7-10

Answer the questions. Write NO MORE THAN TWO WORDS for each answer.

7. What will keep the print separate from the glazing?

8. What backing will be used?

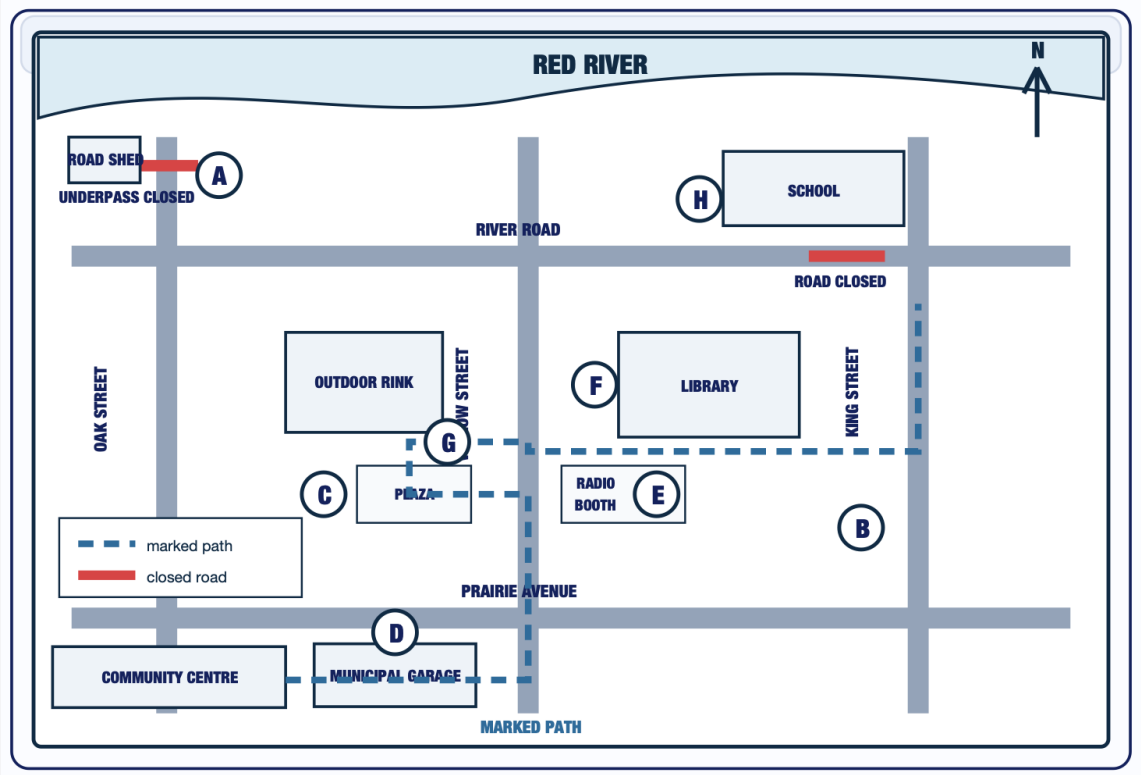

9. What must Eliza bring when she collects the frame?

10. What charge is already included in the total?

Part 2

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Candidate map / plan

Questions 11-14

Which volunteer has each responsibility? Choose the correct person, A-G. You may use any letter more than once.

11. Who checks homes in an assigned area?

A Maya Chen

B Owen Patel

C Lina Brooks

D Marcus Lee

E Helen Ward

F Daniel Kim

G Priya Shah

12. Who accompanies a resident who requested mobility support?

13. Who sends practice messages to residents?

14. Who keeps people away from closed streets?

Questions 15-20

Label the map. Choose the correct letter, A-H.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

15. Where is the sandbag store?

A Location A

B Location B

C Location C

D Location D

E Location E

F Location F

G Location G

H Location H

16. Where is the drinking-water station?

17. Where is the first-aid post?

18. Where is the check-in shelter?

19. Where is the accessible assembly point?

20. Where is the pet holding area?

Part 3

Questions 21-25

Choose the correct purpose, A-G, for each coded stage on the trainees' worksheet.

21. What is the main purpose of worksheet Stage R?

A establish which topics require discussion

B decide whether submitted documents can be used

C set expectations about the process and facilitator role

D collect ideas before judging them

E draft a final outcome for the participants

F hear each person's account before asking follow-up questions

G discover needs behind their stated demands

22. What is the main purpose of worksheet Stage T?

23. What is the main purpose of worksheet Stage K?

24. What is the main purpose of worksheet Stage P?

25. What is the main purpose of worksheet Stage M?

Questions 26-30

Complete the sentences. Write NO MORE THAN TWO WORDS for each answer.

26. Documents will be described as _____ rather than proof.

27. The participants may address each other by their _____.

28. The disagreement about noise will be placed on the shared _____.

29. The trainees will ask what _____ about evenings at home.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

30. Options will be recorded on a _____.

Part 4

Questions 31-36

Complete the notes. Write NO MORE THAN TWO WORDS for each answer.

31. Before night: amount of stored _____ may affect torpor use

32. During torpor: _____ falls substantially

33. Body temperature may approach _____

34. Main immediate benefit: _____

35. Rewarming: heat produced largely by _____

36. After activity resumes: _____ can restore reserves

Questions 37-40

Answer the questions. Write NO MORE THAN TWO WORDS for each answer.

37. What feature of darkness may increase the value of torpor?

38. Besides food conditions, what environmental factor changes the energetic challenge?

39. Which geographical variable distinguished the sites in one Andean study?

40. What should researchers avoid drawing from one population?

Reading

IELTS Academic Reading Practice - Set 28

You should spend about 60 minutes on Questions 1-40.

Original unofficial practice material aligned to the public IELTS Academic Reading format.

Catching Water from Fog

A In dry places, a cloud touching a hillside can carry water past communities that receive little rain. Fog collectors intercept some of that moving moisture without pumps or refrigeration. Their apparent simplicity is deceptive: a panel of netting does not pull vapour from clear air. It works when suspended liquid droplets in fog strike its surface. Output therefore depends on weather, landscape and engineering together. A successful installation must face suitable fog, admit enough air, retain droplets and move the collected water away before wind returns it to the atmosphere. The device is best understood as a chain whose weakest link limits the final yield. Because the system has no powered condenser, it may be cheap to run, but it cannot operate on demand. Storage must bridge the intervals between productive fog events, and users need a separate plan when the season disappoints. Even a well-sited panel must therefore be judged across many events and against the community's demand.

B A large collector is a rectangular frame anchored against strong winds. Across its top, a support cable keeps the capture surface under tension. The main surface is often a double-layer mesh; a narrow layer gap separates the two sheets. Its crossing threads form mesh junctions. The first retained droplets lodge at mesh junctions. There, minute beads meet beads and become larger drops. Once heavy enough, they descend into a collection gutter fixed below the panel. The gutter slopes towards a storage pipe, which carries water to a covered tank. These parts form a continuous route: interception above, enlargement within the net, drainage below and protected transfer beyond the frame.

C The first stage is collision. A droplet following moving air may be intercepted instead of curving around the net. Very small droplets tend to follow the stream, whereas larger ones have more inertia; however, a mesh cannot simply be made solid to catch everything. If its open spaces are too restricted, airflow is diverted around the whole panel. After impact, surface properties determine whether water spreads, remains attached or is blown off. Droplets that stay can merge, and gravity then competes successfully with adhesion, drawing them downward. Efficient collection thus requires both capture and release. A surface that holds every bead indefinitely would be as unhelpful as one from which beads rebound immediately.

D Placement begins with observation rather than construction. Surveyors examine fog frequency, seasonal timing and the direction from which local winds arrive during fog events. A ridge may appear cloudy yet perform poorly if turbulence sends air over and around a proposed panel. Nearby vegetation, rock faces and buildings can also alter the flow. Collectors are normally set across the incoming wind, but the best orientation is a local finding, not a universal compass bearing. Height matters too: a panel close to rough ground can sit in disturbed air, while an exposed crest may impose damaging loads. Pilot collectors are valuable because measured water integrates these factors more reliably than a single visual inspection.

E Mesh design involves another compromise. More filament offers more targets, but less open area can reduce the volume of fog passing through. Two nets with the same nominal density may behave differently because thread width, weave, flexibility and spacing affect both airflow and drainage. A second layer can increase interception, yet the gap between layers must not trap water where it can be re-entrained. Engineers therefore compare designs under the same conditions rather than attributing all variation to material alone. Reported daily yields also need context: a high figure from a brief dense-fog episode cannot describe an entire year, and an average from one ridge should not be transferred automatically to another settlement.

F Operation continues after installation. Dust can coat threads, leaves can block the gutter, and ultraviolet exposure or repeated flexing can weaken netting. Regular inspection removes obstructions and finds tears before they spread. Teams may keep spare mesh on site because a delayed repair during the fog season can forfeit much of the annual supply. Tanks and pipes also require hygienic protection; collecting atmospheric droplets does not by itself guarantee drinkable water. Most importantly, planners should describe fog collection as a supplementary supply where conditions justify it, not as a universal replacement for wells or networks. Modest technology still needs local measurements, secure maintenance

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

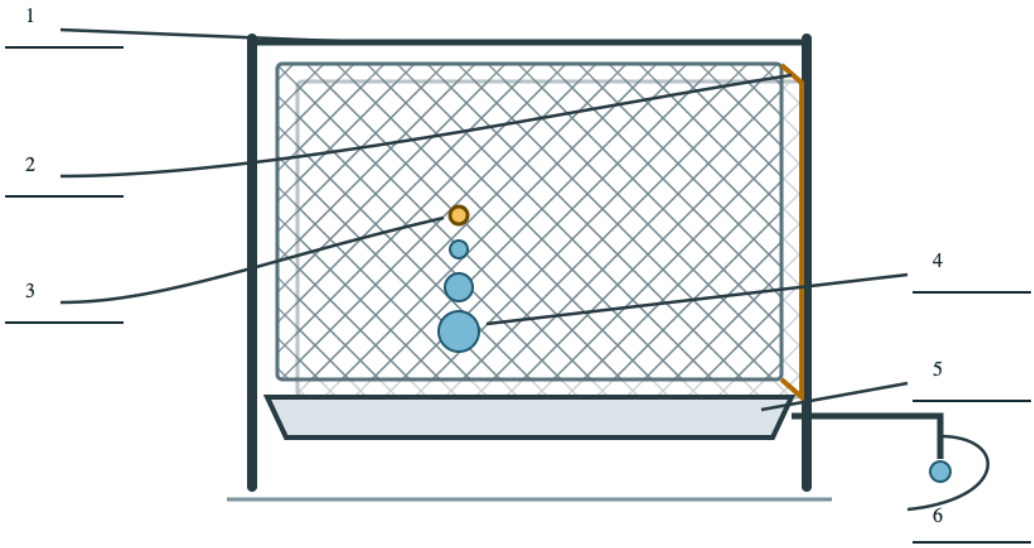

responsibility and a plan for years when fog is scarce.

Questions 1-6

Label the diagram below. Choose NO MORE THAN TWO WORDS from the passage for each answer.

A large fog collector

A large fog collector

Write no more than two words for each label.

Questions 7-13

Complete the sentences below. Choose NO MORE THAN TWO WORDS from the passage for each answer.

7. If mesh openings are too restricted, 7 ____ may travel around the panel.

8. When drops have combined and become heavy, 8 ____ draws them down.

9. Surveyors record the 9 ____ from which local winds arrive during fog events.

10. On a ridge, 10 ____ may carry fog above or around the collector.

11. A coating of 11 ____ can develop on the threads.

12. To avoid long interruptions, repair teams can store 12 ____ locally.

13. The writer recommends presenting fog collection as a 13 ____ rather than a complete substitute.

The Hidden Passengers of Wooden Ports

A For centuries, mariners blamed a 'worm' for timber that failed below the waterline. The name survives, but shipworms are not worms. They are highly modified bivalve molluscs related to clams. Their elongated bodies occupy tunnels in wood, while a pair of very small shells at the front works as a cutting tool. At the other end, siphons reach the surrounding water for respiration and feeding. This unusual anatomy explains why observers classified the animal by its damage long before its relationships were clear. It also explains a persistent historical problem: the destructive organism could remain largely concealed while a hull or harbour pile appeared sound from outside.

B Attack begins when free-swimming larvae settle on suitable submerged timber. After entry, the young animal enlarges a tunnel as it grows, scraping wood with its shells and lining the passage with a thin calcareous layer. Only a small opening for

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

the siphons may remain visible at the surface. Separate tunnels can curve around one another, leaving fragile partitions between them. A heavily occupied beam may consequently keep its external shape even after much internal wood has disappeared. Sudden breakage is therefore not necessarily evidence of sudden attack. It can be the delayed mechanical result of many hidden galleries created over time, a mismatch between visible appearance and remaining strength.

C Shipworm presence is not uniform. Species differ in their environmental tolerances, and both salinity and temperature can limit survival, reproduction or spread. Fresh water excludes many marine wood-borers, which is why river discharge may offer some structures temporary protection. Yet the boundary is neither identical for every species nor fixed through the year. Drought can allow saltier water to move farther into an estuary, while cold periods may slow one population more than another. Historical reports must therefore be read alongside local conditions. The absence of damage in one season does not establish permanent safety, and a defence successful in a cool, brackish harbour may fail after environmental conditions change.

D Wooden shipping also gave these animals a means of travel. Adults living in a hull could release larvae during a voyage or after arrival, and infested timbers could be moved between waterfronts. Expanding trade thus connected habitats that had previously been separated, although reconstructing each introduction is difficult. Old records often use broad names, and damaged wood may have been replaced without scientific identification. Modern surveys can establish present distributions and genetic relationships, but they cannot supply an exact arrival date for every historical population. The strongest account therefore combines biological plausibility with shipping records while acknowledging gaps, rather than turning every new port record into proof of one particular voyage.

E Evidence about hazard changed questions for ports. Because destructive capacity varies among species and environments, wooden maritime construction cannot be managed as one uniform problem. The survey identifies the species posing the greatest danger and recommends monitoring them where wood is extensively used in maritime construction. That response links biological evidence to port maintenance: managers must identify the organisms present, observe local temperature and salinity, and inspect vulnerable timber rather than assume that one design decision provides permanent protection. Construction practice therefore becomes iterative. Materials and exposed members are assessed against local risk, and new observations can alter inspection priorities without claiming that a survey predicts every harbour or season.

F The resulting pattern was uneven. Teredinids occurred at twenty-four of thirty-two surveyed sites, while none recruited to panels at seven sites. Nine species were considered established in European coastal waters, and their ranges were not identical. Some appeared across regions; others within narrower areas. The study related these distributions to temperature and salinity, then identified species whose destructive capacity warranted future field monitoring. A survey could not turn this evidence into a permanent map. Records differed by date, duration and sampling method, while environmental limits varied among species. For harbour managers, the lesson was to assess hazard by place and organism, rather than infer one fixed risk from the general label shipworm alone.

G Today, old submerged timber poses a double question. Archaeologists may value a wreck, quay or defence as evidence, yet raising wood can expose it to decay processes different from those underwater. Leaving it in place may avoid disturbance but does not protect it automatically from wood-borers. Experiments that place standard wooden panels near a site can reveal current attack pressure, while salinity and temperature measurements help interpret the results. Even so, a test panel is a sample, not the monument itself. Conservation decisions must balance access, disturbance, cost and uncertainty. The history of shipworms is thus not a simple contest with a victorious invention; it is a record of repeated adaptation as organisms, shipping networks, materials and human priorities changed.

Questions 14-20

Do the following statements agree with the information given in the passage? Write TRUE, FALSE or NOT GIVEN.

14. Shipworms belong to the same animal group as clams.

15. Adult shipworms begin an attack by entering timber from the water.

16. The calcareous lining of a tunnel is formed before a larva enters the timber.

17. Changes in river flow can alter the protection that low salinity provides.

18. Historical records consistently identified shipworms using modern scientific names.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

19. Researchers concluded that every shipworm species posed the same degree of danger.

20. All seven no-recruitment panel sites were in the Baltic Sea.

Questions 21-26

Which paragraph contains the following information? Choose the correct letter, A-G. You may use any letter more than once.

21. four considerations that must be balanced when deciding how to conserve submerged timber

22. an explanation for why early observers classified the animal according to the damage it caused

23. a direct monitoring recommendation for places where timber is widely used in maritime construction

24. how neighbouring tunnels can leave weak boundaries between them

25. a recommendation to judge danger by both location and organism

26. a limit of modern evidence when dating a past biological introduction

What a Provenance Label Can - and Cannot - Say

A Calls to label synthetic or altered media often assume that a small badge can settle a large question: is this item trustworthy? That expectation confuses provenance with verdict. Provenance concerns the recorded history of an object - who made an assertion about it, what operations were declared and whether the record remains associated with the content. Truth concerns whether claims about the world are accurate. The two can support each other, but neither contains the other. My argument is therefore conditional: provenance labels are useful infrastructure when they expose inspectable claims, yet harmful when interfaces encourage audiences to read them as certificates of truth.

B Open technical standards attempt to make those claims portable. A creator, camera, editor or publisher may attach a manifest describing origin or transformations. Digital signatures can help a verifier determine whether the manifest was altered and which credential was used to sign it. The system is not confined to artificial intelligence: cropping, colour adjustment, publication and other events may also appear. Nor does signature validation prove that every statement inside the record is honest. It establishes a chain of accountable assertions under specified technical rules. This distinction is a strength, not a defect, because it gives later users evidence they can inspect without pretending that software has solved the epistemic problem for them.

C A record needs a human-facing representation, and this is where design choices become governance choices. An icon must be noticeable without overwhelming the material; a short label must be understandable without compressing uncertainty into a binary warning. The most defensible pattern is layered disclosure: a concise signal opens a fuller account of the signer, declared edits and verification status. Some may interpret 'AI involved' as evidence of deception, while others may ignore it. Research on media labels accordingly tests effects on belief and sharing rather than assuming a uniform response. No experiment, however careful, can guarantee that every audience will interpret one symbol identically.

D Absence presents a harder problem than presence. A missing credential may mean that a file predates the system, passed through software that stripped metadata, came from a creator who never adopted the standard, or was deliberately separated from its record. It does not by itself show manipulation. Interfaces should therefore describe an unverified provenance state as unresolved, not automatically false. This restraint matters because any label creates a comparison class. If marked items attract scepticism, unmarked items may gain an undeserved appearance of normality; if credentials become expected, their absence may attract suspicion even when the content is legitimate. The meaning of silence changes as adoption changes.

E That moving baseline creates a coordination problem. Capture devices, editing tools, newsrooms, archives and distribution platforms all handle different links in the chain. If only cameras sign but common editors discard the record, continuity fails. If publishers preserve credentials but platforms hide them, the evidence exists yet remains socially weak. Adoption therefore depends less on one perfect component than on compatible behaviour across institutions. Incentives are uneven: an established publisher may welcome a visible history, a small creator may face extra cost, and a deceptive actor may simply opt out. Policy must address participation and preservation, not merely require a badge at the final screen.

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

F Mandates can help establish expectations, but a rule that freezes one icon or version risks ageing badly. Standards evolve as attacks are discovered, devices change and accessibility research improves. Regulation is better directed at outcomes: provenance information should be interoperable, tamper-evident, available for independent inspection and presented without misleading claims. Procurement can reinforce these outcomes by rewarding tools that preserve records through editing and export. Audit can test whether organisations apply their policies consistently. None of these measures eliminates judgement. Rather, they distribute responsibility so that a platform cannot defend a confusing label merely by saying that a valid record existed somewhere underneath it.

G Evaluation must also look beyond immediate accuracy scores. A label might reduce belief in a misleading item during an experiment yet produce long-term habits that the same study cannot observe. Users may learn to inspect sources, or they may outsource judgement to the interface. Creators may document edits more carefully, or marginalised contributors may lose reach because they lack compatible equipment. Attackers may imitate the appearance of a label even when they cannot produce a valid credential. These possibilities require assessment of distributional effects, interface comprehension, record continuity and adversarial adaptation alongside whether a warning changed one answer on one occasion.

H A mature system would therefore join three layers. Technical records would preserve verifiable assertions about origin and editing. Institutions would publish rules for creating, retaining and displaying those records, with routes for correction and appeal. Media education would teach people to treat provenance as one kind of evidence among others. Success would not mean that every item bears a reassuring mark. It would mean that available claims can be traced, missing claims are described honestly, and important decisions do not rest on an opaque symbol. The label is valuable precisely when it opens inquiry rather than closes it: a doorway into accountable history, not a shortcut around the difficult work of evaluating content.

Questions 27-33

Do the following statements agree with the views of the writer? Write YES, NO or NOT GIVEN.

27. Public calls for media labels can rest on an overly simple expectation.

28. A manifest can indicate which credential was used to sign it.

29. Technical provenance records can describe changes unrelated to artificial intelligence.

30. The writer believes a provenance icon should dominate the material it describes.

31. Research has proved that one provenance icon is understood identically by every audience.

32. The writer believes that a small creator may face an extra cost.

33. The passage gives a minimum percentage of platforms that must adopt the standard.

Questions 34-40

Complete each sentence with the correct ending, A-I, below.

34. The existence of several explanations for a missing credential

35. The comparison class created by a provenance label

36. A mandate tied to one icon or version

37. Regulation focused on outcomes

38. Evaluation beyond immediate accuracy

39. The writer's proposed mature system

40. The proper role of a provenance label

Writing

Writing Task 1

- You should spend about 20 minutes on this task.
- Write at least 150 words.

The maps below show the layout of a disused canal freight yard before and after its proposed conversion into a wetlands learning park.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Writing Task 2

- You should spend about 40 minutes on this task.
- Write about the following topic.
- Give reasons for your answer and include any relevant examples from your own knowledge or experience.
- Write at least 250 words.

Some consumer subscriptions renew automatically at the end of each payment period.

Why do businesses and customers use automatic renewal arrangements? Should businesses be required to obtain fresh confirmation from customers before every renewal?

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Speaking

Part 1

Topic 1

Let's talk about umbrellas.

- When, if ever, do you carry an umbrella?
- Would practicality or appearance matter more if you chose an umbrella?
- Have you ever lent an umbrella to someone or left one somewhere?
- Would a change in your local weather affect how often you use an umbrella?

Topic 2

Now, let's talk about colours.

- Do you have a favourite colour, or is colour not part of your experience?
- When people describe objects in a place where you spend time, is colour useful information, or not?
- Can what people say a colour represents affect how a place feels to you, or not?
- Have your ideas about colours changed over time, or have you never thought much about them?

Topic 3

Now, let's talk about sitting outdoors.

- Where, if anywhere, do you like to sit outdoors?
- What do you usually do while you are sitting outside?
- How do the weather and time of day affect whether you sit outdoors?
- Would you like more places for outdoor sitting near where you live?

Part 2

- Now I'm going to give you a topic, and I'd like you to talk about it for one to two minutes.
- You have one minute to prepare. You can make some notes if you wish.

Describe a public place that is better at a particular time of day.

You should say:

- what the place is
- what time of day is best
- what is different there at that time

and explain why that time makes the experience better.

- Do many other people prefer that time too?
- Would you stay there for long at that time?

Thank you. Now we'll move on to Part 3.

Part 3

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

We've been talking about a public place that is better at a certain time. I'd now like to discuss how shared places and services are scheduled.

- Why do some public places feel more attractive at certain times of day?
- How can the same opening hours affect different groups of people?
- Why can longer opening hours create difficulties for workers or nearby residents?
- Should public facilities use prices or booking rules to spread demand across the day?
- What should authorities consider before keeping public services open late at night?
- How might technology change the way people choose when to use public places in the future?

Thank you. That is the end of the Speaking test.
