IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 29

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

You will hear four recordings. You will hear each recording once only.

Answer all questions and follow the word limit printed above each group.

A separate computer answer-check period follows the recording.

Part 1

Questions 1-6

Complete the laboratory booking form. Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

1. Container: _____

2. Address: Flat 6, _____

3. Sample outlet: _____

4. Collection time: _____

5. During transport: keep the bottle _____

6. Report delivery: results _____

Questions 7-10

Choose the correct letter, A, B or C.

7. Why does Anwen decide not to collect the sample on Sunday?

A The sterile bottles cannot be collected then.

B The sample would have to be stored too long.

C Sunday testing has an additional fee.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

8. Why should Anwen run the tap before filling the bottle?

A To wash the outside of the bottle.

B To sample supplied water after flushing.

C To reach a warmer water temperature.

9. Which testing package does Anwen choose?

A the metals panel

B the basic mineral screen

C the full household package

10. What does Caspian say about the faster service?

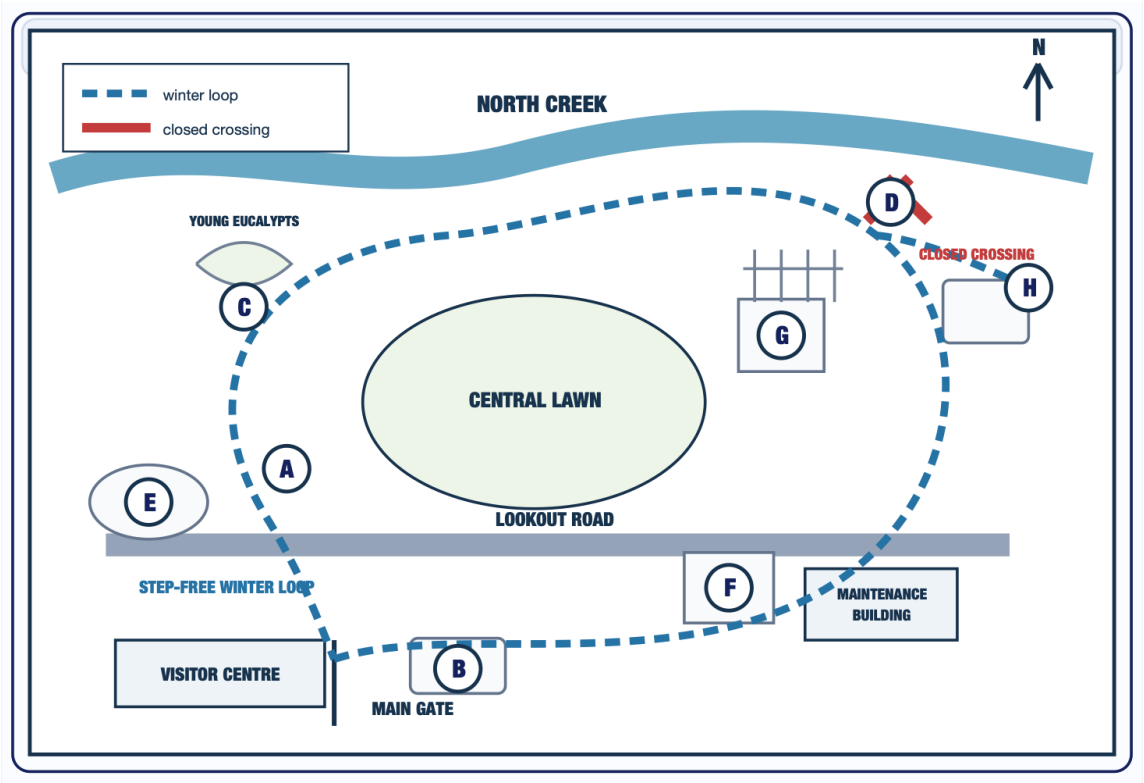

A It takes five working days.

B It is available only for the full package.

C It costs substantially more.

Part 2

Candidate map / plan

Questions 11-16

Label the map. Choose the correct letter, A-H.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

11. Where is the conifer walk?

- **A** Location A
- **B** Location B
- **C** Location C
- **D** Location D
- **E** Location E
- **F** Location F
- **G** Location G
- **H** Location H

12. Where is the warming shelter?

13. Where is the accessible viewing deck?

14. Where is the storm-damaged bridge?

15. Where is the glasshouse?

16. Where is the shuttle bus bay?

Questions 17-20

Choose the correct feature, A-F, for each sector.

17. Which feature is highlighted in the Alpine sector?

- **A** an indoor display about leaf structure
- **B** sheltered forms of low conifers
- **C** numbered working labels
- **D** contrasts in bark colour
- **E** a seasonal flower collection
- **F** a sound installation

18. Which feature is highlighted in the Eucalypt sector?

19. Which feature is highlighted in the Rainforest sector?

20. Which feature is highlighted in the Research plots?

Part 3

Questions 21-25

Choose the correct letter, A, B or C.

21. What do the students identify as the most serious flaw in the pilot study?

- **A** The rooms were measured on different days.
- **B** The meters recorded at different times.
- **C** The batteries were not equally new.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

22. What was wrong with the original occupancy record?

A It included students' names.

B It was completed before each class.

C It did not track changes during measurement.

23. What do they decide to do about blind positions?

A record them with photographs and codes

B leave every blind fully open

C ask the lecturer to adjust them

24. Which rooms will form the main comparison?

A the largest and smallest rooms

B two similar rooms with different shading

C two rooms with identical windows

25. Which sampling schedule do they choose?

A continuous logging in one room

B readings at random times each day

C fixed paired times with repeats if needed

Questions 26-30

Choose the correct revision, A-G, for each problem.

26. Which revision addresses this problem: the meters give different values?

A repeat the paired readings

B check both instruments against a reference

C count users at each measurement

D replace both sensor batteries

E photograph and code the setting

F mark the tripod positions on the floor

G exclude the room from the study

27. Which revision addresses this problem: tables have been moved?

28. Which revision addresses this problem: occupancy changes during a reading?

29. Which revision addresses this problem: blind positions are inconsistent?

30. Which revision addresses this problem: cloud cover changes rapidly?

Part 4

Questions 31-36

Complete the notes. Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

31. Spring inflow may deposit pale _____.

32. A darker summer layer may contain _____.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

33. A _____ can preserve delicate surface layers.

34. Fine layer pairs may be counted using a _____.

35. One possible marker horizon is _____.

36. Mixing by organisms is called _____.

Questions 37-40

Answer the questions. Write NO MORE THAN TWO WORDS for each answer.

37. Which independent method can check a varve chronology?

38. What type of retrieval damage can shorten the recovered sequence?

39. What should researchers compare to separate local and regional patterns?

40. What can varves alone not identify?

Reading

Read the three passages and answer Questions 1-40. You have 60 minutes, including checking time.

Original unofficial IELTS Academic practice material aligned to the public format; it is not an official IELTS test.

Why Old Walls Need a Patient Mortar

A When the joints of an old stone wall begin to crumble, replacing them can look like a straightforward filling job. Yet traditional masonry was assembled as a system in which units, mortar and moisture interacted. A very hard modern repair may appear tidy while changing where stresses and water travel. Conservation work therefore begins by asking how the wall was intended to behave, not merely which binder reaches the highest laboratory strength. Lime mortar is often selected because its comparatively accommodating character can suit older, porous materials. That choice is not automatic: exposure, stone type, previous repairs and workmanship still have to be examined.

B Lime begins with limestone heated so that carbon dioxide is driven off, leaving quicklime. Adding water to quicklime, a reaction known as slaking, releases heat and produces hydrated lime. When sufficient water is used and the material is allowed to mature, the workable binder is commonly called lime putty. Sand is then combined with the binder to provide body, control shrinkage and create a pore structure. The proportions and grading must be appropriate to the job; a recipe copied from a different building or climate is not evidence of compatibility. Preparation establishes possibilities, but curing determines whether those possibilities are realised.

C A freshly placed lime mortar does not become sound simply by drying as rapidly as possible. It needs moisture while its particles settle and early reactions proceed, so the surface is protected from strong sun, drying wind and frost. The aim is damp rather than saturated conditions: excessive water can wash out binder, whereas severe drying can interrupt development and cause powdering. Carbonation occurs as carbon dioxide from the air dissolves in moisture and reacts with hydrated lime, gradually forming calcium carbonate. The gas reaches the interior through open pores, which is one reason an excessively dense mix or sealed surface can cure unevenly.

D The pore network continues to matter after curing. Rain can enter a wall through exposed surfaces and small defects, but moisture also has to leave. Within the wall, liquid travels towards an evaporation surface; after evaporation, connected pores permit water vapour to pass outwards. If an impermeable repair blocks that route, moisture may be displaced into the adjacent brick or stone. Salts can then crystallise there, and freezing may intensify damage. Calling lime “breathable” is convenient shorthand, but it should not be treated as magic: detailing, roof drainage, ground moisture and the condition of the masonry remain part of the explanation.

E Mechanical compatibility is equally important. Many traditional walls contain units softer than modern engineering brick and were built to tolerate small seasonal movements. A repair with very high compressive strength can concentrate strain at the edge of a stone rather than within the joint. Conservators often prefer the mortar to act as the sacrificial joint: it should weather first and be replaceable before valuable masonry is lost. This does not mean weak or poorly made mortar is desirable. It means performance is judged relative to the surrounding fabric, expected exposure and the joint's intended role, rather than by strength alone.

F Good repointing consequently starts with diagnosis and careful removal. A worker records the existing joint profile, identifies areas that are genuinely loose and avoids cutting sound arrises with aggressive tools. Failed material is removed to a depth that allows the new mortar to bond, while dust is cleared and very dry masonry is lightly pre-dampened. Mortar is compacted in layers instead of being smeared as a thin surface ribbon. The finished joint is then tended during early curing. These operations are slower than cosmetic covering, but they connect the repair to sound material and reduce abrupt changes in moisture behaviour.

G Lime repair is therefore a process rather than a branded product. The binder, aggregate, joint geometry, weather and aftercare must be considered together. Test panels can reveal differences in colour, texture and workability before a whole elevation is altered. Records of the mix and curing conditions help later teams understand what was done, especially because a wall may respond across seasons rather than days. Where cement-rich pointing has already trapped moisture, selective replacement may be sensible, but wholesale removal can also damage the masonry. The most defensible intervention is proportionate, observable and open to maintenance instead of promising a permanent cure. That distinction

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

remains important in any careful practical interpretation.

Questions 1-7

Choose the correct heading for each paragraph, A-G, from the list of headings below. There are more headings than paragraphs, so you will not use them all.

i	The stages that produce a workable lime binder
ii	Practical steps that make replacement durable
iii	Allowing the joint to fail before the masonry
iv	Looking beyond the apparent simplicity of repair
v	A cautious strategy rather than a universal cure
vi	Routes by which a wall releases moisture
vii	Environmental control while a new joint develops
viii	Why the strongest available mixture is always preferred
ix	Decorative uses of coloured aggregate

1. Paragraph A

2. Paragraph B

3. Paragraph C

4. Paragraph D

5. Paragraph E

6. Paragraph F

7. Paragraph G

Questions 8-13

Complete the sentences below. Choose NO MORE THAN TWO WORDS from the passage for each answer.

8. After quicklime has been slaked with enough water and matured, the binder is usually called 8 ____.

9. During early curing, the preferred condition is 9 ____ rather than fully saturated.

10. Carbon dioxide travels into the mortar through 10 ____.

11. After evaporation, connected pores allow 11 ____ to pass outwards.

12. A repair with excessive 12 ____ may transfer strain to the edge of a stone.

13. Ideally, the mortar serves as the 13 ____ and is replaced before historic masonry is lost.

Can a Museum Keep a Smell?

A Museums have long built collections around objects that can be seen and touched, while smell was often treated as incidental or troublesome. Yet odours can carry evidence about materials, work and domestic routines. The scent of a wooden interior may include resin, smoke, polish and products of slow decay; remove one source and the perceived history changes. Smell is also unstable. Volatile compounds disperse, react and are replaced by later treatments, so today's odour is neither a sealed message from the past nor meaningless contamination. Preserving olfactory heritage begins with documenting that changing mixture and the context in which people interpret it.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

B The first challenge is deciding what, exactly, deserves preservation. A characteristic smell may come from the original material, from use, from age or from conservation treatment. Cleaning can remove compounds that curators later realise were informative, while retaining every residue may accelerate deterioration or expose people to hazards. Placing an object in a closed container can slow the loss of volatiles, but it does not freeze the chemistry. Conservators therefore record condition, known treatments and sensory descriptions before intervening. The record may become more durable than the odour itself and can explain why a later presentation differs from an earlier one. Repeated documentation is useful because both the object and the vocabulary used to describe it can change over time.

C Instrumental analysis offers one kind of record. In headspace sampling, researchers collect vapours in the air around an object or interior without necessarily removing solid material. Analytical equipment can then separate and identify many volatile compounds. The resulting profile is valuable for comparison and for detecting substances that require caution. It is not a photograph of smell, however. Instruments may register chemicals below a person's sensory threshold, while interactions among compounds can change what is perceived. Sampling conditions, temperature and the materials used to trap vapours also influence the profile, so method details belong in any reusable odour archive. Curators can revisit these records when storage conditions change, when an object travels, or when later analysis identifies a compound that earlier equipment could not distinguish reliably.

D Human description supplies information that instruments cannot. A sensory panel may compare intensity, character and change over time, using agreed terms after training and discussion. Memories and cultural associations vary, so a panel does not convert a subjective response into an eternal fact. It can, however, make the conditions of judgement visible and reveal whether several observers notice a similar quality. To reduce suggestion, initial sensory sessions can be conducted without telling panellists which compounds an instrument detected. Chemical and sensory records are then compared, rather than allowing one to dictate the language of the other. A review can then separate physical change in the collection from changes in sampling method or descriptive vocabulary.

E Sometimes the aim is public interpretation rather than storage. A reconstructed odour may combine available materials to evoke a documented environment. Exact chemical duplication is rarely the only goal: an original recipe might contain irritants, protected animal products or ingredients that no longer behave as they did. A safer substitute can preserve a recognisable relationship to the historical account while reducing risk. The reconstruction should therefore be labelled as an interpretation, with its evidence and substitutions stated. Otherwise, visitors may mistake a contemporary design decision for a substance recovered intact from the past. A reconstruction can also be revised when new evidence appears, provided earlier versions and decisions remain traceable.

F Delivery changes the conservation problem again. Pumping scent continuously through a gallery may contaminate nearby objects, exhaust visitors' attention and create an experience that is stronger than the historic setting. Some museums instead use personal scent stations, sealed samples or timed release. These arrangements limit spread and allow equipment to be cleaned, although they also separate the odour from the room or activity that once gave it meaning. The best arrangement depends on purpose, dose, ventilation and context rather than novelty alone. Ventilation and neighbouring displays need attention before any public release begins.

G Ethics connects every stage. Curators need to distinguish an object's material emissions from a commissioned reconstruction, and they should not imply certainty where identification is tentative. Visitors may have asthma, chemical sensitivity, pregnancy-related nausea or simply no wish to participate. Advance warning, an unscented route and a way to stop exposure give them meaningful choice. Consultation can also reveal that a smell celebrated by one group recalls dangerous or degrading work for another. Olfactory heritage is worth preserving precisely because it adds human complexity; treating access, evidence and consent as afterthoughts would flatten that complexity into spectacle. This choice also keeps interpretation accountable when institutions revise a display, its equipment, or the evidence behind it.

Questions 14-20

Do the following statements agree with the information given in Passage 2? Write TRUE if the statement agrees, FALSE if it contradicts the passage, or NOT GIVEN if there is no information on this.

14. Historically significant smells can change as volatile substances disperse.

15. Sealing a scented object prevents any further chemical change.

16. Headspace sampling always requires a piece of solid material to be removed from an object.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

17. A sensory panel should contain at least twelve trained people.

18. A reconstructed historical smell may use a safer replacement for an original ingredient.

19. Personal scent stations cost less to maintain than timed-release systems.

20. Museums should warn visitors about scent and provide a way to avoid exposure.

Questions 21-26

Which paragraph contains the following information? Choose the correct letter, A-G. You may use any letter more than once.

21. a warning that a conservation action can erase evidence before its value is recognised

22. a method for preventing analytical results from influencing people's first descriptions

23. a reason for replacing a historically documented ingredient

24. an explanation of why a present-day smell cannot be treated as an unchanged message

25. a technique that collects material from the air near an item

26. examples of circumstances in which visitors may prefer not to encounter a smell

Citizens' Juries and the Hard Choices of Infrastructure

A Infrastructure decisions combine technical uncertainty with arguments about who should pay, which places should bear disruption and what future risks deserve priority. Public meetings often reward those able to attend and speak confidently, while opinion surveys reveal preferences without showing how they respond to evidence. A citizens' jury offers a different instrument. A small group of residents is selected, briefed, allowed to question witnesses and asked to deliberate before producing recommendations. Its purpose is not to replace elected authority or professional design. Properly used, it creates a structured test of reasons that conventional consultation can miss.

B Selection is central to that claim. Volunteers alone may reproduce the most organised voices, so organisers commonly recruit from a broad pool and use stratified selection to improve descriptive representation across factors such as age, gender, location and social background. This does not create a miniature population in a statistical sense, nor can it guarantee that every lived experience appears. A panel is too small for that. The stronger argument is comparative: transparent recruitment can produce a group less self-selecting than an open hearing. Participants also need payment and practical support, or selection on paper will not translate into equal ability to attend. It also gives future panels a starting point instead of requiring every group to rediscover the same institutional constraints.

C Information design determines what the jury can actually deliberate. Jurors may receive written summaries, hear advocates with competing positions, question technical specialists and request clarification. A balanced process does not pretend that all claims have identical evidential weight. It makes the basis of disagreement inspectable and gives participants more than one route to challenge it. Witness lists, briefing materials and declared interests should be published. Otherwise, an organiser can shape the apparent consensus by narrowing the evidence before discussion begins, while still presenting the final meeting as citizen-led. A public archive of materials, questions and official replies also lets later communities judge whether the same standards were applied when political priorities or project sponsors changed.

D Facilitation presents a subtler risk. A skilled facilitator protects speaking time, asks participants to explain terms and prevents a confident minority from dominating. The objective is not to make disagreement disappear. Pressure to reach a neat unanimous statement can conceal genuine differences or encourage tired jurors to accept vague language. Reports should preserve minority reasoning where it matters. A larger panel may include more perspectives, yet it can leave less speaking time for each participant; organisers therefore weigh size against the mandate, resources and diversity required. Transparent procedures matter more than the ceremonial label attached to the event. Independent observation can reveal whether formal rules were followed in practice as well as described in advance.

E The recommendation mandate must be settled before recruitment. Officials should state whether the jury will rank options, advise on conditions, identify unacceptable trade-offs or examine a defined question. They should also explain who retains the decision and what response will follow. A jury recommendation is not automatically implemented, and pretending

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

otherwise transfers accountability without legal authority. Conversely, inviting citizens to deliberate and then offering no reasoned reply treats their labour as decoration. A published response can show which recommendations were adopted, modified or rejected and on what grounds. Agencies should retain the evidence pack and response so later reviews can distinguish a changed judgement from a forgotten promise.

F Advocates sometimes answer concerns about expertise too casually. Ordinary citizens do not become engineers after several briefing sessions. Yet that observation does not make their contribution irrelevant. Specialists can estimate capacity, cost and failure probability; citizens can question assumptions about acceptable inconvenience, distribution and precaution. The useful division is not experts versus the public, but distinct forms of judgement brought into a common process. Jurors need enough time and support to interrogate specialists, and decision-makers still need competent technical appraisal after the panel reports.

G Cost and delay are real objections. Recruitment, accessibility support, evidence preparation and facilitation require resources, and a badly timed jury can duplicate statutory consultation. The case is strongest where choices are consequential, contested or difficult to reverse, not for every routine maintenance decision. Evaluation should also extend beyond whether jurors enjoyed the event. It should examine the fairness of recruitment, the quality of reasoning, changes to the eventual decision and the official response. Without that wider view, a polished process can be praised even when it has no influence or entrenches an unrepresentative frame. Trust depends on this institutional memory, especially when construction extends across electoral cycles.

H The long-term question is whether deliberation becomes part of institutional learning. A single jury can help with a particular route, reservoir or energy connection, but repeated panels reveal whether agencies improve evidence, explain constraints and respond consistently. Repetition alone is no guarantee: a formula can harden into theatre. The safeguard is a visible chain from mandate through recruitment and evidence to recommendation and response. Citizens' juries are therefore neither a democratic cure nor an expensive distraction by definition. They are conditional tools whose legitimacy depends on design and on their accountable connection to the decisions they are meant to inform. The distinction matters.

Questions 27-31

Do the following statements agree with the views of the writer in Passage 3? Write YES if the statement agrees, NO if it contradicts the writer, or NOT GIVEN if the writer gives no clear view.

27. Citizens’ juries should take final decision-making power away from elected representatives.

28. Stratified selection can make a jury less self-selecting, although it cannot include every experience.

29. Giving jurors several ways to question evidence can make disagreements more transparent.

30. The writer considers independent observation more effective than published procedures.

31. The writer believes a jury’s recommendations should be binding on officials.

Questions 32-36

Complete each sentence with the correct ending, A-H.

32. Effective facilitation

33. A clear recommendation mandate

34. A published official response

35. The expense of a jury

36. The repeated use of well-designed panels

Questions 37-40

Choose the correct letter, A, B, C or D.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

37. What danger does the writer associate with pressure for unanimity?

A Witnesses may refuse to attend.

B Recruitment will become more expensive.

C Officials may disclose confidential budgets.

D Real disagreements may be hidden by a tidy statement.

38. Why does the writer reject the idea that non-specialists have no useful role?

A They can master engineering calculations during a short briefing.

B They can examine value judgements and question expert assumptions.

C They are more accurate than specialists at predicting project costs.

D They can remove uncertainty from technical evidence.

39. According to the writer, a proper evaluation should include

A only participants' satisfaction with the event.

B the number of technical documents distributed.

C the quality of reasoning and effects on the eventual decision.

D whether the jury met for longer than the statutory consultation.

40. Which statement best expresses the writer's conclusion?

A Citizens' juries can add value when their design and link to authority are accountable.

B Citizens' juries should become legally binding in every infrastructure case.

C Citizens' juries are mainly symbolic and should usually be avoided.

D Citizens' juries work best when experts do not participate.

Writing

Writing Task 1

- You should spend about 20 minutes on this task.
- Write at least 150 words.

The table below shows the percentages of five kinds of fresh food discarded by households in one region when the food was kept under three different storage conditions.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Percentage of five fresh foods discarded under three household storage conditions

% of purchased quantity

Fresh food	Refrigerated	Countertop	Ventilated box
Leafy greens	9%	34%	21%
Berries	12%	29%	24%
Tomatoes	18%	16%	10%
Root vegetables	8%	11%	7%
Fresh herbs	14%	41%	28%

Source: author-created fictional household data for WeLearn Original Practice

WeLearn Original Practice

Writing Task 2

- You should spend about 40 minutes on this task.
- Write about the following topic.
- Give reasons for your answer and include any relevant examples from your own knowledge or experience.
- Write at least 250 words.

Employers should be legally required to publish a salary range in every job advertisement.

To what extent do you agree or disagree?

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Speaking

Part 2

Describe a person who stayed calm in a difficult situation.

You should say:

- the person involved and the difficulty they faced
- what the person did
- how other people reacted

and explain why the calm response was effective or memorable.

Approved accommodation: Use only an accommodation already authorised for this candidate.
