IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 31

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

Part 1

Questions 1-6

1. Customer surname: _____

2. Item: _____

3. Main fault: _____

4. Cover material selected: _____

5. Collection time: _____

6. Workshop entrance: _____

Questions 7-10

7. Which fitting will be replaced?

8. What caused the staining?

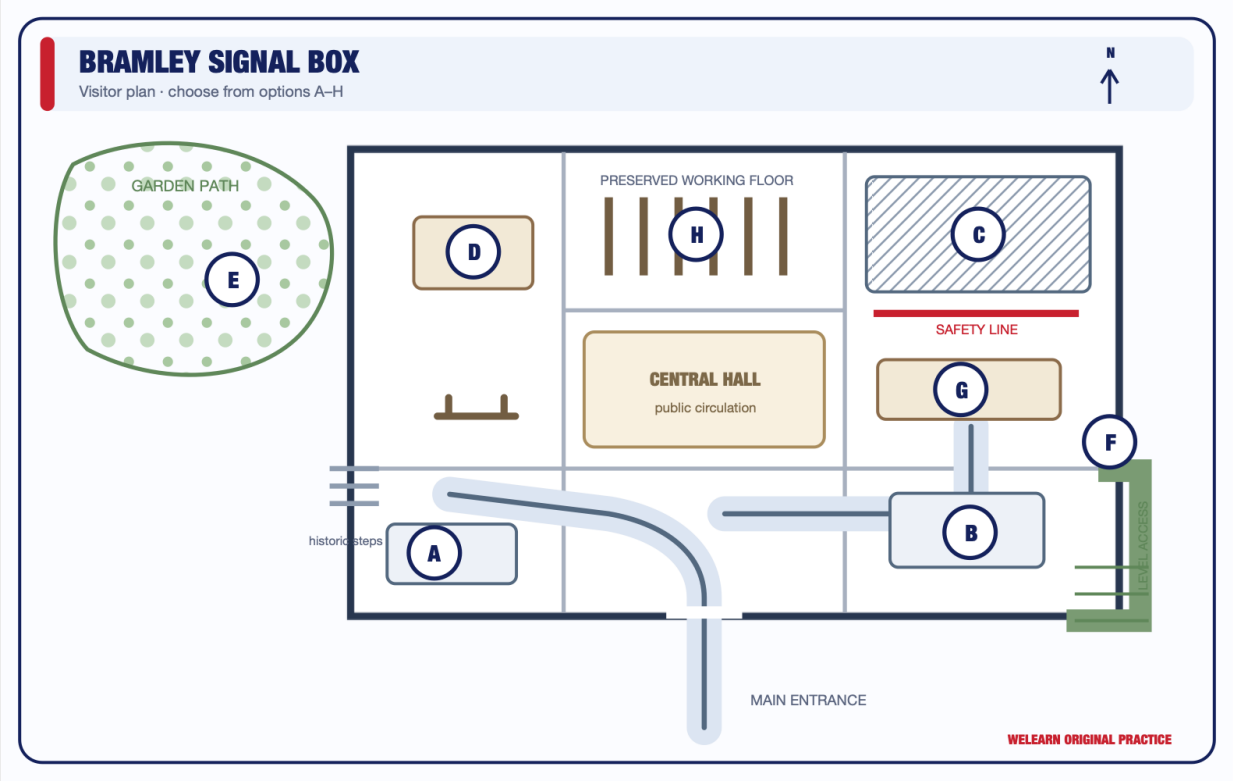

9. How will the estimate be sent?

10. What is the maximum approved cost?

Part 2

Candidate map / plan

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Questions 11-16

11. Map location: reception

12. Map location: accessible ramp

13. Map location: viewing platform

14. Map location: lever frame

15. Map location: token room

16. Map location: quiet bench

Questions 17-20

17. Morning signal demonstration

- **A** token room
- **B** garden shelter
- **C** viewing platform
- **D** family carriage
- **E** lever frame
- **F** repair workshop

18. Token exchange demonstration

19. Family activity

20. Accessible tour start

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Part 3

Questions 21-25

21. Why change the first site?

- **A** It was too far from the laboratory.
- **B** Its riverbank had become unsafe.
- **C** It had already been sampled this year.

22. What is the main role of the field blank?

- **A** To measure the water temperature
- **B** To estimate the volume collected
- **C** To reveal contamination introduced during handling

23. How will bottles be labelled?

- **A** With waterproof labels linked to the field log
- **B** By writing the site name only on the lid
- **C** With a colour chosen after laboratory analysis

24. When will gloves be changed?

- **A** Only when a glove is visibly torn
- **B** After all samples from one river are complete
- **C** Between sites and after handling equipment

25. What does a non-detection mean?

- **A** The species is certainly absent.
- **B** Any DNA present may be below the detection limit.
- **C** The laboratory method has failed.

Questions 26-30

26. Boat contamination control

- **A** extraction blank
- **B** chilled transport
- **C** triplicate samples
- **D** clean launch point
- **E** matched tidal window

27. Laboratory bias control

28. Weather variation control

29. Transport control

30. Replicate strategy

Part 4

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Questions 31-36

31. The darkest layers are rich in _____ oxides.

32. Fine _____ contributes to the matrix.

33. Local chemistry may be influenced by _____.

34. Airborne _____ supplies particles.

35. Interpretation also requires _____.

36. Growth occurs in _____.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Questions 37-40

37. What does thickness fail to provide?

A A precise chemical composition

B The direction of prevailing winds

C A dependable age for the coating

D The original colour of the rock

38. What should researchers combine?

A Microscopic, chemical and environmental evidence

B Thickness measurements from one surface

C Colour photographs taken at midday

D Reports from a single field visit

39. What may expose an uncoated surface?

A A period of high humidity

B A newly detached flake

C A rise in airborne dust

D A change in mineral colour

40. What is the lecturer’s conclusion?

A One biological process explains every coating.

B Thick coatings can be dated without context.

C Several interacting processes must be evaluated together.

D Rock varnish develops at a constant rate.

Reading

Cooling without machinery

A Evaporative clay coolers exploit a familiar physical change: liquid water absorbs heat as it becomes vapour. In a common design, a smaller porous clay vessel sits inside a larger one, with wet sand packed into the gap. Food is placed in the inner pot, the opening is covered with a damp cloth, and the whole device stands in shade. Moving air carries water vapour away from the outer surface. Although the principle is old, performance depends on details such as wall thickness, vessel geometry and the area exposed to the air; a locally successful design cannot simply be copied at another scale and expected to behave identically. The two vessels should not touch, because direct contact creates an uncontrolled route for heat. A narrow, evenly packed gap makes later comparisons more meaningful.

B Porosity is essential. Water must migrate slowly through the outer wall before it can evaporate, so a glazed vessel performs poorly even if the sand inside remains wet. At the other extreme, clay with very large pores may leak faster than evaporation can use the water. Makers therefore test vessels before pairing them. The wet sand serves as a reservoir and maintains contact around the inner chamber, but flooding the gap is unnecessary and may waste water. The aim is a controlled supply to the surface, not a permanently overflowing container.

C The surrounding atmosphere determines how rapidly that surface water can leave. Steady airflow replaces moist air close to the pot with drier air, whereas still conditions allow a humid boundary layer to form. High humidity reduces cooling because air already near saturation can accept little additional vapour. This explains why the same cooler may achieve a useful temperature difference on a dry afternoon yet show little change after rain. Measurements of air temperature and relative humidity are consequently needed whenever results from different days or regions are compared.

D Location can either support or defeat the mechanism. Direct sunshine adds heat to the vessel, while an enclosed room restricts the movement of air; neither is suitable. A shaded veranda with cross-ventilation is usually better. Raising the pot on a stable stand improves airflow beneath it and prevents water pooling around the base. Very strong wind is not automatically beneficial, however, because it can raise consumption beyond what a household can replenish. Placement therefore involves a balance between ventilation, protection from radiant heat and practical access to water. Wind exposure should be assessed where the cooler will actually be used, rather than at a distant weather station whose buildings and vegetation may create different conditions.

E A clay cooler is not a refrigerator. Its internal temperature follows weather conditions and does not remain at the consistently low level required for meat, dairy products or medicines. It may nonetheless slow wilting and moisture loss in some fruit and vegetables. The benefit varies with crop type, initial condition and local climate. Responsible descriptions state those limits: reducing produce temperature by several degrees may extend freshness, but it is not equivalent to meeting a regulated cold-storage threshold.

F Routine care is simple but consequential. Clean water reduces deposits; a damp cloth over the opening excludes many insects; and washing the inner chamber prevents food residues from accumulating. In hard-water areas, minerals can gradually block the pores, so gentle brushing is preferable to detergents that may leave their own residue. Cracks require attention because a vessel that leaks rapidly no longer cools evenly. Between uses, the food chamber should dry fully, and the cover should be washed rather than merely re-wetted.

G Where electricity is unreliable, repairability may be as important as cooling capacity. The vessels can often be made locally, users can see when water needs replacing, and a damaged outer pot can be changed without discarding the inner one. Yet this simplicity also exposes a constraint: the system consumes water and demands daily attention. In a persistently humid or water-scarce place, those requirements may outweigh the benefit. Calling the design ‘off-grid’ therefore does not establish that it is appropriate for every household beyond the electricity network.

H A fair trial records internal and ambient temperatures, humidity, airflow and the condition of comparable batches of produce over time. Researchers also measure water consumption and distinguish an immediate temperature drop from an actual extension of storage life. A single cool reading or striking photograph is weak evidence because weather and starting quality can dominate the result. Replicated household trials weigh produce at intervals, use a defined spoilage scale and report bruising present at the outset. This fuller record allows users to judge a practical trade-off among freshness, water

use and maintenance instead of treating the lowest temperature observed as the only outcome. Investigators also document how often water is added and who performs the maintenance. A device that works only under unusually attentive supervision may be unsuitable in routine household use.

Catalogues as networks

A Early commercial seed catalogues combined prices with descriptions, cultivation advice, illustrations and instructions for postal ordering. They were commercial objects, but they also reveal how firms imagined their customers and how plant varieties entered public discussion. Their evidence is selective. A company printed what it hoped to sell, so the absence of a crop cannot prove that gardeners no longer grew it through local exchange. Historians read the catalogue as a cultural and commercial intervention rather than a complete biological inventory.

B Printed names are particularly unstable evidence. A firm might rename one strain for a regional market, while unrelated plants could share an attractive popular label. Historians therefore compare descriptions with trial records, correspondence and surviving seed collections. They track traits, dates and provenance instead of trusting spelling alone, and they mark an identification as provisional when those sources conflict. Digitisation makes searches faster, but a precise-looking database entry does not remove uncertainty inherited from the historical page. Marginal notes written by customers can sometimes clarify a local name, but they must be dated before being treated as evidence contemporary with the printed list.

C Pictures helped readers imagine an unfamiliar crop, yet they were designed to persuade as well as describe. Colour printing could exaggerate size, brightness or uniformity, and artists often worked from an ideal specimen. A useful analysis compares an illustration with the qualifications in the accompanying text and with images in later editions. Reuse is revealing: the same picture could survive while a recommended growing region changed, showing that the image belonged to a marketing strategy rather than to a neutral visual record.

D Postal ordering extended the reach of specialist firms. Seeds travelled with invoices and growing instructions, while some customers returned reports about germination, flavour or unexpected colour. This feedback was uneven and commercially filtered, but it linked growers, merchants and breeders across distance. Complaints could alter a later description, although firms also had reasons to defend a profitable line. Correspondence thus records a two-way exchange that the polished catalogue page alone tends to conceal. Surviving order books are especially useful because they show which advertised items were actually requested, separating the catalogue’s ambitions from realised demand.

E Catalogues organised the year as well as the market. Publication schedules anticipated sowing seasons, and tables grouped crops by maturity. Claims for an early-ripening variety had particular force in regions with short summers. Spring issues promoted crops that could be sown immediately, whereas autumn lists emphasised bulbs and varieties requiring longer planning. Comparing editions across regions shows how commercial seed firms adapted both timing and editorial emphasis to local growing conditions.

F Plant breeders used catalogues to distribute new material and to watch competing introductions. Public research stations tested advertised varieties under specified conditions, while amateur societies exchanged seed outside commercial channels. These routes overlapped without being controlled by one institution. A trial might confirm yield in one environment yet reject a promise of universal performance. Such disagreement is valuable because it separates promotional language from evidence produced by breeders and research stations.

G What survives in an archive is not a random sample. Prestigious catalogues were often bound and preserved; colourful editions attracted collectors; cheap local lists and working copies were discarded after orders were placed. Historians must therefore correct for a record that over-represents large firms and elaborate printing. The survival of a luxurious catalogue demonstrates that somebody saved it, not that its format typified ordinary trade. Archival absence must be interpreted with the same caution as commercial silence. Researchers compare holdings from national libraries, regional archives and private collections to estimate which kinds of publication are missing from any one repository.

H The most productive studies connect printed promises with correspondence, institutional trials and surviving plant material. Page images should accompany transcribed records so readers can inspect uncertain names, punctuation and reused illustrations. Linked evidence can reveal how migration, climate and customer feedback shaped circulation, but it should preserve disagreement rather than force every source into one tidy list. A stable name may conceal biological change, and a renamed strain may retain substantial continuity. Catalogues are therefore best understood as nodes in networks of commerce, experiment and persuasion.

Many futures, one forecast

A A deterministic weather forecast presents one simulated future from a selected estimate of the atmosphere's current state. Ensemble prediction instead runs many related simulations, varying starting conditions, uncertain model processes or even the models themselves. The ensemble spread is useful information because observations and equations are imperfect. Perturbations remain small: the purpose is to sample plausible uncertainty around the present atmosphere, not to compare unrelated weather situations. The distribution of outcomes shows where apparently minor differences grow into materially different forecasts.

B When members remain close, forecasters may have greater confidence in the broad evolution shown; when they diverge, the atmosphere may be near a sensitive transition. Neither pattern is a guarantee. Tightly clustered members can share a model error, so low spread sometimes gives false confidence. Forecast centres compare past spread with past error to test whether apparent certainty has been justified. This process exposes structural weaknesses that adding more nearly identical simulations would not solve. Forecasters also inspect whether spread grows at a realistic rate through the forecast period. A system that remains artificially narrow can appear decisive while systematically under-representing uncertainty.

C For many decisions, probabilities are more useful than a single most-likely value. A transport manager considering disruptive snow faces different costs from a walker deciding whether to carry a coat. Even when both receive the same probability, their thresholds for action differ. A wide ensemble spread may indicate sensitivity or insufficient evidence, while the resulting forecast probabilities let users combine likelihood with consequence. The model does not choose the action; it supplies a structured description of uncertainty for the decision-maker.

D Communicating that description is difficult. Some users mistake a low probability for impossibility; others treat any mention of danger as certainty. Cones, plumes and percentile ranges can display variation, but viewers need to know which interval is shown and whether rare outcomes fall beyond it. Calibrated verbal labels may help, yet no graphic removes judgement. Effective communication pairs the probability with the potential impact and states what remains outside the displayed range.

E Ensemble size influences how well rare outcomes are sampled, but more members are not the only route to improvement. Better observations, more realistic physical processes and correction of systematic bias may change reliability more than another set of runs. Computing resources impose a trade-off: a centre can increase the number of members or devote more power to finer resolution that represents terrain and storms. The best allocation depends on the forecast purpose and on which source of error currently dominates.

F Verification asks whether issued probabilities match observed frequencies over many cases. If events assigned a twenty per cent probability occur about once in five, that category is calibrated. Calibration alone is insufficient, because a forecast that always repeats the climatic average can be reliable yet uninformative. Analysts also examine sharpness - the justified ability to move probabilities away from that average. A useful system combines calibration with discrimination rather than protecting its record through permanently cautious forecasts. Verification is divided by season, lead time and event type because good average performance can conceal weakness in precisely the situations that matter most to a user.

G Uncertainty should be exposed and used, not hidden behind one line on a map. This does not mean that every member deserves identical operational weight. Forecasters inspect clusters, current observations and known regional biases. Expert interpretation is essential when measurements conflict with simulations or when a model weakness affects the event of interest. The aim is not to select a favourite member but to explain how each body of evidence changes the distribution of plausible outcomes.

H Ensembles are decision tools, not collections of rival prophecies. Their value depends on technical quality and on whether users connect probabilities with impacts and decision thresholds. Sector-specific systems increasingly estimate outcomes such as a road closure rather than snowfall alone, but that translation adds assumptions about exposure and vulnerability that also require verification. Transparent products state where model output ends and impact modelling or expert judgement begins. Archives of forecasts and outcomes then allow users to examine routine misses as well as memorable successes, making uncertainty available for disciplined action rather than disguising it. Training is most effective when users practise with archived cases, choose an action before seeing the outcome and then discuss why the same probability supported different defensible decisions.

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

1. The vessels must be made from _____.

2. The space between the two pots is filled with _____.

3. Cooling occurs when water leaves the surface through _____.

4. Food is placed inside the _____.

5. The whole device should be kept in _____.

6. Steady _____ helps carry moisture away.

7. Performance falls when the surrounding _____ is high.

8. Which paragraph explains why a glazed vessel performs poorly?

9. Which paragraph describes the climatic condition that reduces cooling?

10. Which paragraph compares suitable and unsuitable locations?

11. Which paragraph warns against treating the device as a refrigerator?

12. Which paragraph describes cleaning and insect control?

13. Which paragraph discusses repairability and water use together?

14. Which paragraph explains how researchers make a fair comparison?

15. Choose the most suitable heading for paragraph A.

I Catalogues as commercial and cultural evidence

II Images that persuade as well as describe

III Publication schedules and regional adaptation

IV Unstable names and the need for corroboration

V Breeders, stations and amateur exchange

VI Postal ordering and customer feedback

VII Selective survival in archives

VIII A complete biological inventory

16. Choose the most suitable heading for paragraph B.

17. Choose the most suitable heading for paragraph C.

- **I** Catalogues as commercial and cultural evidence
- **II** Images that persuade as well as describe
- **III** Publication schedules and regional adaptation
- **IV** Unstable names and the need for corroboration
- **V** Breeders, stations and amateur exchange
- **VI** Postal ordering and customer feedback
- **VII** Selective survival in archives
- **VIII** A complete biological inventory

18. Choose the most suitable heading for paragraph D.

- **I** Catalogues as commercial and cultural evidence
- **II** Images that persuade as well as describe
- **III** Publication schedules and regional adaptation
- **IV** Unstable names and the need for corroboration
- **V** Breeders, stations and amateur exchange
- **VI** Postal ordering and customer feedback
- **VII** Selective survival in archives
- **VIII** A complete biological inventory

19. Choose the most suitable heading for paragraph E.

- **I** Catalogues as commercial and cultural evidence
- **II** Images that persuade as well as describe
- **III** Publication schedules and regional adaptation
- **IV** Unstable names and the need for corroboration
- **V** Breeders, stations and amateur exchange
- **VI** Postal ordering and customer feedback
- **VII** Selective survival in archives
- **VIII** A complete biological inventory

20. Choose the most suitable heading for paragraph F.

- **I** Catalogues as commercial and cultural evidence
- **II** Images that persuade as well as describe
- **III** Publication schedules and regional adaptation
- **IV** Unstable names and the need for corroboration
- **V** Breeders, stations and amateur exchange
- **VI** Postal ordering and customer feedback
- **VII** Selective survival in archives
- **VIII** A complete biological inventory

21. Who used catalogues principally to sell and distribute named varieties?

A commercial seed firms

B historians using archives

C plant breeders and research stations

22. Who compare printed names with trial records and correspondence?

A commercial seed firms

B historians using archives

C plant breeders and research stations

23. Who monitored competing introductions while distributing new material?

A commercial seed firms

B historians using archives

C plant breeders and research stations

24. Who timed publications to anticipate sowing seasons?

A commercial seed firms

B historians using archives

C plant breeders and research stations

25. Who must account for the selective survival of luxury catalogues?

A commercial seed firms

B historians using archives

C plant breeders and research stations

26. Who tested advertised varieties through public institutions?

A commercial seed firms

B historians using archives

C plant breeders and research stations

27. The author believes ensemble spread should be treated as useful information.

A YES

B NO

C NOT GIVEN

28. The author argues that tightly clustered members guarantee an accurate forecast.

A YES

B NO

C NOT GIVEN

29. The author states that every transport authority uses the same snow threshold.

A YES

B NO

C NOT GIVEN

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

30. The author considers probability more useful than a single value for many decisions.

A YES

B NO

C NOT GIVEN

31. The author believes uncertainty should be hidden from non-specialists.

A YES

B NO

C NOT GIVEN

32. A wide _____ can signal sensitivity or insufficient evidence.

33. Decision-makers can act on forecast _____ rather than one value.

34. Improving models may matter more than merely adding members when there is _____.

35. A probability system is _____ when forecast frequencies agree with outcomes.

36. Users need to connect forecasts with consequences and decision _____.

37. Why can a cluster of ensemble members still be wrong?

A The atmosphere stops changing.

B The members may share a model error.

C The observation network becomes perfect.

D The ensemble contains too many members.

38. What does the author identify as a communication risk?

A Users always demand a single map.

B Probabilities cannot be verified.

C A low probability may be mistaken for impossibility.

D Verbal labels are prohibited.

39. Which improvement is explicitly presented as an alternative to simply adding members?

A Better representation of physical processes

B Removing observational data

C Publishing fewer forecasts

D Giving every member a name

40. What is the main conclusion?

A Ensembles should replace expert forecasters.

B Only the most extreme member matters.

C Probabilities are useful only for scientists.

D Ensemble forecasts are decision tools whose uncertainty needs interpretation.

Writing

Academic Writing - WeLearn Original Practice

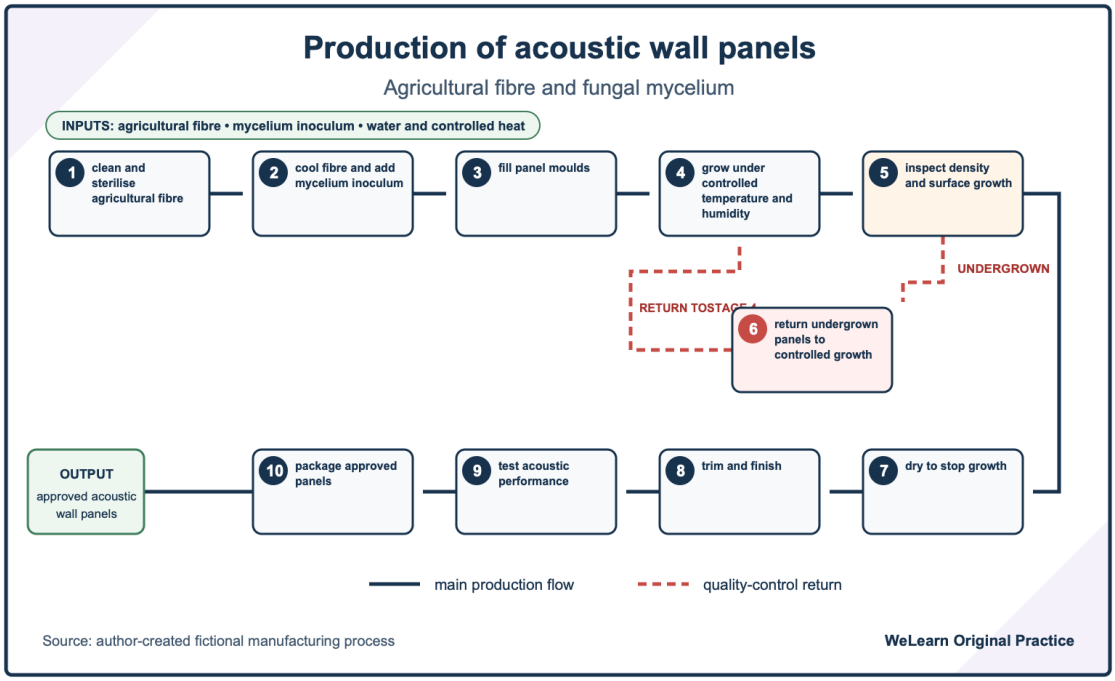

You should spend about 60 minutes on both tasks.

Task 2 contributes twice as much as Task 1 to the Writing score.

WRITING TASK 1

The diagram below shows how acoustic wall panels are produced from agricultural fibre and fungal mycelium.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

WRITING TASK 2

Many city governments are considering strict limits on large digital advertising screens in streets and public squares.

What are the main advantages and disadvantages of such limits? Do the advantages outweigh the disadvantages?

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Speaking

Part 1

Coins

- How often do you use or notice coins?
- Have you ever kept a coin for a special reason?
- What are the advantages and disadvantages of small change?
- How have your payment habits changed?

Windows

- What kinds of windows do you notice in daily life?
- Does the view from a window affect a room?
- How do people balance privacy and natural light?
- Would you change any windows where you live?

Quiet sounds

- What quiet sounds do you notice?
- Which quiet sounds do you enjoy or dislike?
- Do background sounds affect your concentration?
- Are quiet places different in towns and the countryside?

Part 2

Describe a time when a plan changed unexpectedly.

You should say:

- what the original plan was
- why it changed
- what you did next
- and explain what you learned from the change.
- Did the changed plan work out well in the end?
- Would you respond differently if something similar happened again?

Part 3

- When should organisations change their plans?
- How should uncertainty be communicated?
- Is flexibility more important than consistency?
- Why do people resist changes to plans?
- How can trust be rebuilt after a disruptive change?
- How might planning systems develop in the future?
