IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 32

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

Part 1

Questions 1-6

1. Researcher surname: _____

2. Map sheet: _____

3. Original scale: _____

4. Calibration item: _____

5. Declared use: _____

6. Delivery method: _____

Questions 7-10

7. Why is rights status checked?

- **A** To establish who physically owns the paper map
- **B** To determine whether the scan may be republished
- **C** To decide which scanner can hold the sheet

8. What will remain visible?

- **A** The archive assistant’s handwritten notes
- **B** The protective sleeve around the original
- **C** The map’s marginal annotations and scale information

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

9. Which licence is chosen?

A A licence permitting use in the named scholarly article

B A licence for unrestricted commercial advertising

C A private-viewing licence with no publication

10. Why will a proof image be sent before the final file?

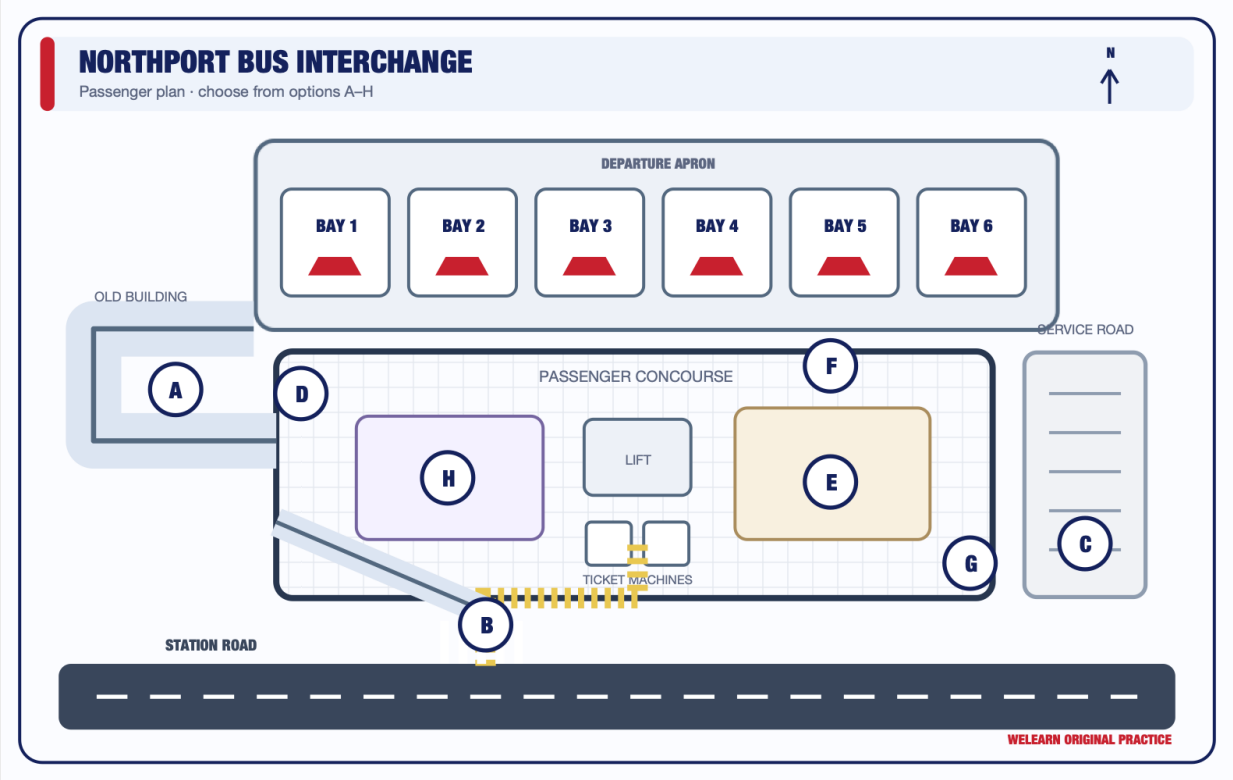

A To check the sheet number, orientation and crop

B To judge the map's precise colour before calibration

C To replace the archive metadata record

Part 2

Candidate map / plan

Questions 11-16

11. Map location: signal crossing

12. Map location: mobility desk

13. Map location: quiet waiting room

14. Map location: taxi rank

15. Map location: information point

16. Map location: sheltered link

Questions 17-20

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

17. Coastal service bay

- **A** Bay 1
- **B** Bay 2
- **C** Bay 3
- **D** Bay 4
- **E** Bay 5
- **F** Bay 6

18. Airport service bay

19. Evening local service bay

20. Replacement service bay

Part 3

Questions 21-25

21. Why standardise vessel size?

- **A** To make every pot identical in colour
- **B** To prevent size from confounding the comparison
- **C** To reduce the amount of clay collected

22. What is the control group?

- **A** Vessels made from the same clay without added temper
- **B** Vessels placed closest to the fire
- **C** Vessels fired on a different day

23. Why not move pots?

- **A** They would cool too quickly after firing.
- **B** Their labels might become detached.
- **C** Movement would introduce uncontrolled temperature variation.

24. Why reject a second firing?

- **A** It would require a different clay source.
- **B** Weather and fuel conditions could not be held constant.
- **C** The pots could not be photographed twice.

25. What is the main improvement?

- **A** Replacing all measurements with photographs
- **B** Using a hotter fire than earlier studies
- **C** Adding witness tiles around the firing area

Questions 26-30

26. Keep _____ similar.

27. Record the _____ before firing.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

28. Log _____ during the firing.

29. Place _____ around the fire.

30. Classify damage by _____.

Part 4

Questions 31-36

31. Water rises under _____.

32. Air in a conduit forms an _____.

33. Spread may be limited by _____.

34. Plants reduce loss by closing _____.

35. Closure restricts uptake of _____.

36. Species differ in their _____.

Questions 37-40

37. What helps plants reach deep water?

38. Which measurement time may mislead?

39. What must remain functional?

40. How may damaged tissue be replaced?

Reading

Casting a line of type

A A line-casting machine began with a keyboard, but pressing a key did not print a letter. It released a small brass matrix from a magazine above the operator. Each matrix carried the recessed mould for one character. The selected matrices travelled down channels and gathered in sequence at the assembler, where the operator could inspect the line before casting. This separation between selection and printing was central: the keyboard organised reusable moulds rather than striking inked type directly onto paper. Magazines held multiple fonts and sizes, so the operator selected the appropriate bank before beginning. Copy was marked with type instructions, and a wrong selection could require several lines to be reset even when every word had been keyed correctly.

B A line had to fill a prescribed width even when its words did not do so naturally. The operator inserted wedge-shaped spacebands between words. Once the matrices reached the correct sequence, the machine expanded those spacebands until the row fitted the measure. The spaces, not the letters, absorbed the extra width. This mechanical justification produced a straight right-hand edge while preserving the chosen type size, although poor spacing decisions could still leave an unattractive page. Operators judged spacing while reading ahead. A line with too many wide gaps was often reset rather than accepted merely because it reached the measure. Thus mechanical expansion depended on typographic judgement about what readers would find tolerable.

C At the casting station, molten type metal was forced against the aligned matrices to form one solid line, known as a slug. After cooling, the slug moved to a tray for page assembly, while the matrices were lifted away for reuse. Casting an entire line reduced the handling of individual pieces of type, but accuracy still mattered: a wrong matrix embedded an error in metal and usually required the whole line to be cast again. The moulding cycle was rapid, but the metal needed a controlled composition and temperature. Metal that was too cool might not fill fine details; excessive heat increased wear and made the working environment more hazardous. Rejected slugs returned to the melting pot.

D Mechanisation changed compositors' work without removing skill. Keyboard operators had to read copy rapidly, anticipate line length and notice errors before casting. Machinists diagnosed jams, controlled metal temperature and adjusted alignment. Proofreaders then compared the cast text with the manuscript. The technology redistributed expertise among specialised roles; it did not turn composition into an automatic process requiring no judgement. Speed and accuracy were measured together. An operator who produced many lines but forced frequent recasting could delay the page more than a slower colleague whose copy required little correction. Training therefore included rhythm, abbreviation conventions and the diagnosis of recurring faults.

E After casting, the matrices rose to a distributor. Their coded teeth differed by character, and a rotating mechanism carried each matrix along the distribution channel until the pattern matched the entrance to its own magazine slot. It then dropped into place for reuse. A damaged or incorrectly coded matrix could enter the wrong channel and later produce a puzzling substitution, so cleaning and inspection were part of routine operation. Distribution allowed the same matrices to circulate repeatedly during a shift. It was one reason the machine could sustain newspaper production without storing a separate piece of type for every occurrence of a common letter.

F The composing room combined speed with hazards. Operators worked beside molten metal, hot surfaces and moving mechanisms, while fumes and metal dust required ventilation. Noise made conversation difficult, and a jam could tempt an impatient worker to reach into machinery. Safe production therefore depended on guards, disciplined maintenance and the handling of metal residues as carefully as on typing speed. Modern demonstrations use barriers and safer materials because historical practice is not an acceptable safety standard. Ventilation also protected the quality of casting by controlling heat around the machine. Safety and output were intertwined: neglected cleaning increased both mechanical faults and workers' exposure to residues.

G Photocomposition and later digital systems eventually replaced line casting in most newspaper plants. Text could be stored, corrected and arranged without producing a metal slug for every line, shortening revision and removing much hot-metal handling. Adoption was gradual rather than instantaneous: firms often ran old and new systems together while staff learned new processes and managers tested whether deadlines and page assembly remained reliable. The change reorganised whole production schedules, not merely the operator's keyboard. Some occupations disappeared, others

narrowed, and new work developed in photographic processing, electronic typesetting and system maintenance. Describing the transition simply as deskilling misses that uneven redistribution.

Growing food on uncertain ground

A Urban allotment soil may contain lead, arsenic or other contaminants from former workshops, demolition, traffic emissions, painted structures or imported fill. A concentration is not a complete statement of risk. Exposure also depends on how the land is used, who uses it, how contact occurs and whether the contaminant is readily absorbed. Reconstructing the site's history from maps and files is therefore an efficient first step: it suggests what to test, but it cannot replace physical sampling. Children may receive a larger dose from the same contact because of hand-to-mouth behaviour and lower body mass. The planned users of a site therefore belong in the initial assessment, not as an afterthought once numbers arrive.

B Appearance is unreliable. A clean layer at the surface may conceal older material below, while an industrial past does not mean that every part of a site is equally affected. Digging, drainage work and deep roots can reconnect layers that once seemed separate. Historical research helps identify former sheds, painted fences, sidings or dumping areas, yet those clues remain hypotheses until samples from known depths and locations are analysed. Community memories can identify short-lived uses that never appeared on formal maps. Such testimony guides investigation but still requires corroboration, because dates and exact locations may be uncertain.

C Sampling design determines what conclusions are possible. Composite samples made from several small portions can estimate an area's average condition, but they may dilute a local hotspot. Targeted sampling is preferable where records or visible remains suggest a specific source. Beds, paths and play areas may need separate treatment because patterns of contact differ. Numerical screening values also vary among jurisdictions; each reflects local assumptions about land use and exposure rather than a universal boundary between safe and unsafe soil. A sampling plan should be written before results are known. Moving points after seeing unexpectedly high or low values can bias the picture of the site unless the change is recorded as a separate follow-up investigation.

D Laboratories add their own quality controls. Field duplicates reveal small-scale variability, blank samples test contamination during handling, and chain-of-custody records show where each container travelled. Results must then be interpreted against the planned use of the plot and the relevant local guidance. An isolated number without its location, depth, method and uncertainty cannot support a major decision, however precise the decimal places appear. Accredited methods report detection limits and measurement uncertainty. A result below a laboratory's reporting threshold is not proof that the substance is absent; it means the method did not quantify it at that level.

E Proportionate precautions can reduce contact while investigation continues. Gardeners can place verified clean soil in raised beds, cover busy paths and avoid carrying soil into homes. These measures interrupt exposure, but they do not remove contamination from the underlying land. Barriers need inspection when beds are repaired or roots penetrate deeply. Their purpose is managed separation, not a permanent declaration that the original soil has become clean. Mulch or vegetation can suppress dust on paths, but bare patches must be repaired. Raised beds also require clean compost and careful edging so that underlying soil is not brought to the surface during maintenance.

F Food crops differ in how they interact with contaminants. Uptake into tissue varies by chemical and species, while soil particles adhering to leaves or roots may contribute substantially to exposure. Washing produce, peeling where appropriate and washing hands and tools can interrupt these exposure routes. Fruiting crops often behave differently from leafy vegetables, so advice should distinguish crop types rather than assume that every plant transfers contaminants in the same way. Preparation habits matter. Shaking soil from roots outdoors and keeping gardening footwear out of living areas reduce transport of particles without making unsupported claims about plant uptake.

G Adding compost may improve structure but does not make an unknown contaminant disappear. Capping, excavation or long-term controls should follow a professional assessment that considers extent, depth, exposure and regulation. Such decisions should not rest on a single sample. A qualified assessment integrates site history, a defensible sampling plan, laboratory controls and the intended land use before recommending costly remediation. Excavation can itself create dust and contaminated waste, so removal plans must specify worker protection, transport and lawful disposal. An apparently decisive remedy may otherwise shift exposure elsewhere.

H A transparent report records the site history, sampling positions, depths, methods, results and limitations. It explains which precautions remain sensible and where uncertainty persists. The passage does not prescribe a fixed number of safe

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

gardening hours because exposure depends on activities and conditions, not time alone. Clear maps and units allow future gardeners to understand what was tested, while follow-up sampling can check whether barriers or replacement soil still perform as intended. The goal is a documented management plan, not a timeless certificate of safety. Communication should distinguish a screening value from a diagnosis. Exceeding a screen usually signals the need for closer assessment; it does not by itself specify the eventual remedy or prove that harm has occurred.

Markets inside organisations

A An internal prediction market lets employees trade contracts tied to future events, such as whether a project will meet a deadline. The changing price summarises participants' willingness to back an outcome. Supporters value the mechanism because it can aggregate dispersed information that staff may hesitate to voice in meetings. A technician who sees a supply problem and a salesperson who notices weak demand can both affect the estimate without first producing a single agreed narrative. Contracts can also be designed around sales, regulatory approval or completion of a technical milestone. Each captures a different uncertainty, so combining them into one broad question can hide which part of a project participants doubt.

B A market price is not automatically true. Participation may be thin, incentives may be weak, and several traders may rely on the same mistaken source. Protected anonymity can reduce pressure from organisational rank, allowing a junior employee to express a pessimistic view, but it cannot create independent evidence. Design and culture determine whether a price reflects broad knowledge or merely the confidence of a small group. Correlated information is a particular danger when many employees rely on the same dashboard or manager. Numerous trades may then create an appearance of consensus without adding independent observations.

C Contracts must describe a specified event and date. 'The product launches by 30 June' can be settled mechanically; 'the project is successful' cannot, unless success has already been defined. Precise wording prevents organisers from changing the meaning after forecasts are made and makes disputes easier to resolve. It also tells participants what evidence is relevant instead of asking them to price a vague aspiration. Settlement sources should be named in advance - for example, a signed acceptance record or a published launch date. Otherwise two honest participants may interpret the same event differently.

D Credibility accumulates through visible settlement under stable rules. When an event occurs, the organisation should publish how the contract was resolved and pay or score it according to the rule announced at the start. Cancelling inconvenient questions or redefining deadlines teaches employees that conformity matters more than accuracy. A repeated record of fair settlement is therefore more important than an elaborate trading interface. Stable rules include a declared response to cancellation, postponement and missing evidence. Edge cases are not administrative trivia; unresolved ambiguity reduces willingness to trade in later rounds.

E Incentives require balance. Virtual currency and modest prizes can widen participation without exposing employees to financial loss. Real stakes may focus attention in some settings, but they also introduce legal, ethical and equity concerns. The author does not claim that one arrangement always outperforms the other. What matters is whether the reward is sufficient to encourage considered forecasts without turning participation into gambling or excluding staff. Participation time is another cost. If trading requires constant attention, the market may privilege employees whose jobs allow frequent screen access rather than those with the best information.

F Fear can nullify the mechanism. If employees believe a pessimistic trade will damage their career, they may stay silent or imitate senior opinion. A market then reproduces the hierarchy it was meant to bypass. For this reason, a price is best treated as an early-warning signal: an unexpected movement should trigger interviews, checks of project data or scenario analysis, not an automatic managerial command. Confidential reporting channels may still be needed because a price shows that concern exists without revealing its factual basis. Investigation supplies the explanation that trading alone cannot provide.

G Leaders must be willing to examine inconvenient results. They should compare the market with surveys, expert panels and later outcomes, recording where the methods disagree. Participation and liquidity should accompany any headline price because a precise number can conceal very few trades. Regular evaluation shows whether forecasts are calibrated and whether information reaches the market in time to influence a decision. Calibration should be examined across many contracts, not inferred from one celebrated success. Organisations also need to record forecasts that attracted little activity, since selective evaluation exaggerates performance.

H The conclusion is conditional. Internal markets can complement organisational decisions when questions are resolvable, participation is broad, settlement is credible and governance protects honest disagreement. Their usefulness declines where outcomes cannot be verified or fear suppresses participation. Procedures should name who reviews a signal, how conflicting evidence is recorded and when further investigation is required. The market earns authority through accountable performance over time, not through the market label or the visual precision of a price. A market should be discontinued when it repeatedly lacks participation or when settlement cannot be insulated from managerial discretion. Maintaining a visible number under those conditions adds theatre rather than evidence.

1. Pressing the _____ releases character matrices.

2. Brass _____ carry the moulds for individual characters.

3. Characters are gathered at the _____ before casting.

4. A complete line is formed at the _____.

5. Expandable _____ make the line reach the set width.

6. Coded teeth guide matrices through the _____.

7. Choose the most suitable heading for paragraph A.

I Producing a cast line

II From keyboard to assembled matrices

III Distributing matrices by coded teeth

IV Digital replacement of hand composition

V Expanding spaces to justify a line

VI Skill after mechanisation

VII Working conditions and production risks

VIII Newspaper ownership patterns

8. Choose the most suitable heading for paragraph B.

14. Urban allotment contamination can originate from several different historical activities.

A TRUE

B FALSE

C NOT GIVEN

15. A clean-looking surface proves that deeper soil is uncontaminated.

A TRUE

B FALSE

C NOT GIVEN

16. Every city uses the same numerical soil-screening values.

A TRUE

B FALSE

C NOT GIVEN

17. Combining samples can conceal a small local hotspot.

A TRUE

B FALSE

C NOT GIVEN

18. Raised beds remove contaminants from the underlying land.

A TRUE

B FALSE

C NOT GIVEN

19. Soil particles on produce may contribute to exposure.

A TRUE

B FALSE

C NOT GIVEN

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

20. The passage gives a fixed safe number of hours for weekly gardening.

A TRUE

B FALSE

C NOT GIVEN

21. Begin by examining maps and files to reconstruct the site's _____.

22. Use _____ where earlier activities suggest a particular concern.

23. Clean soil can be placed in _____ to reduce contact.

24. Hand washing and ground cover interrupt possible _____.

25. Major remediation should follow a _____ rather than one isolated result.

26. A good final document is a _____ that explains sampling and limitations.

27. The author believes internal markets can reveal information absent from meetings.

A YES

B NO

C NOT GIVEN

28. The author claims market prices are automatically true.

A YES

B NO

C NOT GIVEN

29. The author states that financial contracts always outperform virtual currency.

A YES

B NO

C NOT GIVEN

30. The author supports stable settlement rules.

A YES

B NO

C NOT GIVEN

31. The author recommends using prices as commands to managers.

A YES

B NO

C NOT GIVEN

32. Which feature can reduce pressure from organisational rank?

A large financial stakes

B protected anonymity

C vague settlement rules

D manager-controlled outcomes

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

33. Which feature makes a contract easier to settle?

A a broad idea of success

B a changing deadline

C a specified event and date

D an undisclosed scoring rule

34. Which practice is linked to credible operation?

A visible settlement under stable rules

B punishment of pessimistic forecasts

C restricting participation to managers

D treating prices as orders

35. Which condition most limits the usefulness of an internal market?

A staff have different information

B forecasts are reviewed with other evidence

C contracts use virtual currency

D fear discourages honest participation

36. What is the author's preferred role for a market price?

A a final command

B an early-warning signal

C a replacement for project data

D a measure of employee loyalty

37. What central limitation does the author emphasise?

A Markets cannot use dates.

B Employees never hold useful information.

C Design and culture determine what prices mean.

D Only external traders can participate.

38. Why must outcomes be precisely defined?

A So contracts can be resolved without dispute

B So managers can change them secretly

C So all prices remain equal

D So participation becomes compulsory

39. Which statement best reflects the conclusion?

A Internal markets are reliable in every workplace.

B Anonymous trading should be banned.

C Market prices should replace expert panels.

D Markets can complement decisions under specific governance conditions.

Writing

Academic Writing - WeLearn Original Practice

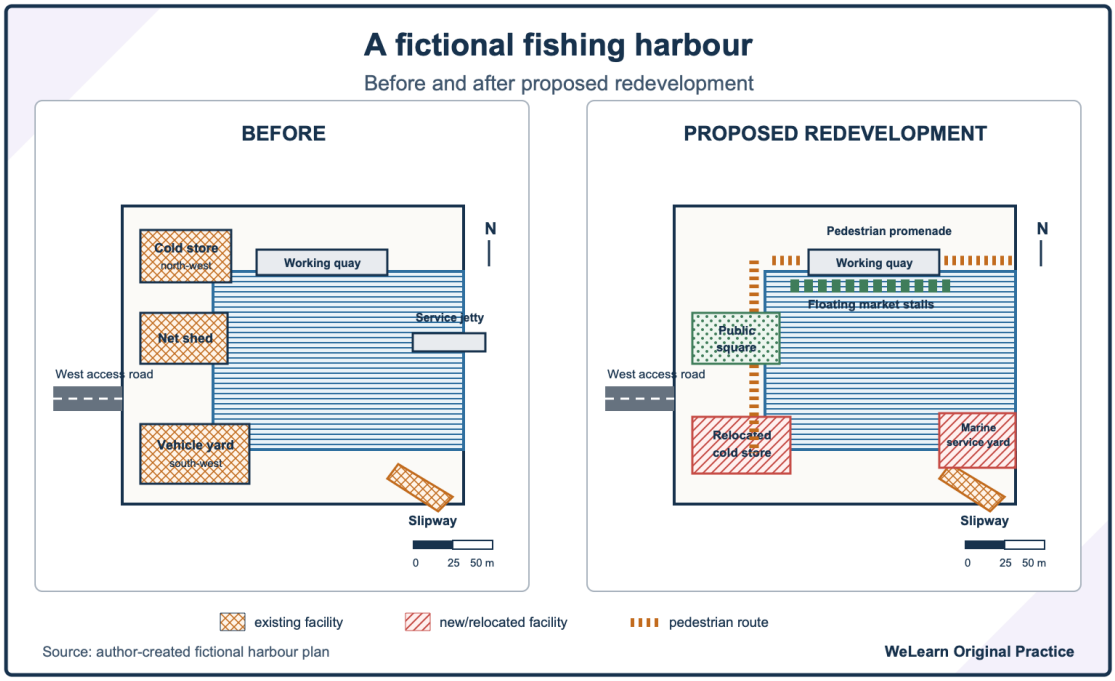

You should spend about 60 minutes on both tasks.

Task 2 contributes twice as much as Task 1 to the Writing score.

WRITING TASK 1

The maps below show a fictional fishing harbour before and after a proposed redevelopment.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

WRITING TASK 2

Publicly funded research is increasingly expected to make its methods and underlying data freely available.

Why is open access to methods and data increasingly requested? Do you think open release should normally be mandatory?

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Speaking

Part 1

Fasteners

- What fasteners do you use on clothes or bags?
- Which fasteners are easiest or most difficult to use?
- Do you notice the appearance of fasteners?
- Has your use of them changed?

Plants in small spaces

- What plants do you see in small spaces?
- Do you keep any plants?
- What are the benefits and difficulties of indoor plants?
- What would you change about the plants around you?

Voice messages

- Do you send voice messages?
- When are voice messages useful?
- What are their advantages and disadvantages?
- Have they changed how you communicate?

Part 2

Describe a public announcement you remember.

You should say:

- where and when you heard it
- what the message was and how it was delivered
- how people responded
- and explain why it was effective or ineffective.
- Did people understand the announcement immediately?
- Would the message have worked as well through a different channel?

Part 3

- What qualities make a public warning effective?
- How should announcements balance clarity and urgency?
- Why do people sometimes ignore repeated warnings?
- How should mistaken public information be corrected?
- Who is responsible for maintaining trust in public messages?
- Which communication channels may matter most in the future?
