IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 34

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

You will hear four recordings. You will hear each recording once only.

Answer all questions and follow the word limit printed above each group.

A separate two-minute computer answer-check period follows the recording and is not synthesised as silence.

Part 1

Questions 1-6

Complete the notes. Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

1. Customer surname: _____

2. Number of knives: _____

3. Longest blade: _____ cm

4. Special edge: _____

5. Collection date: _____

6. Items must be placed in protective _____

Questions 7-10

Choose the correct letter, A, B or C.

7. Why will one knife be inspected before pricing?

A its handle is loose

B its tip is damaged

C its blade is unusually long

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

8. Which return method does Tamsin choose?

A collection from the workshop

B delivery on the next round

C a tracked return parcel

9. What should Tamsin write on the outer box?

A the booking code

B the value of the knives

C the word fragile

10. When will the final cost be confirmed?

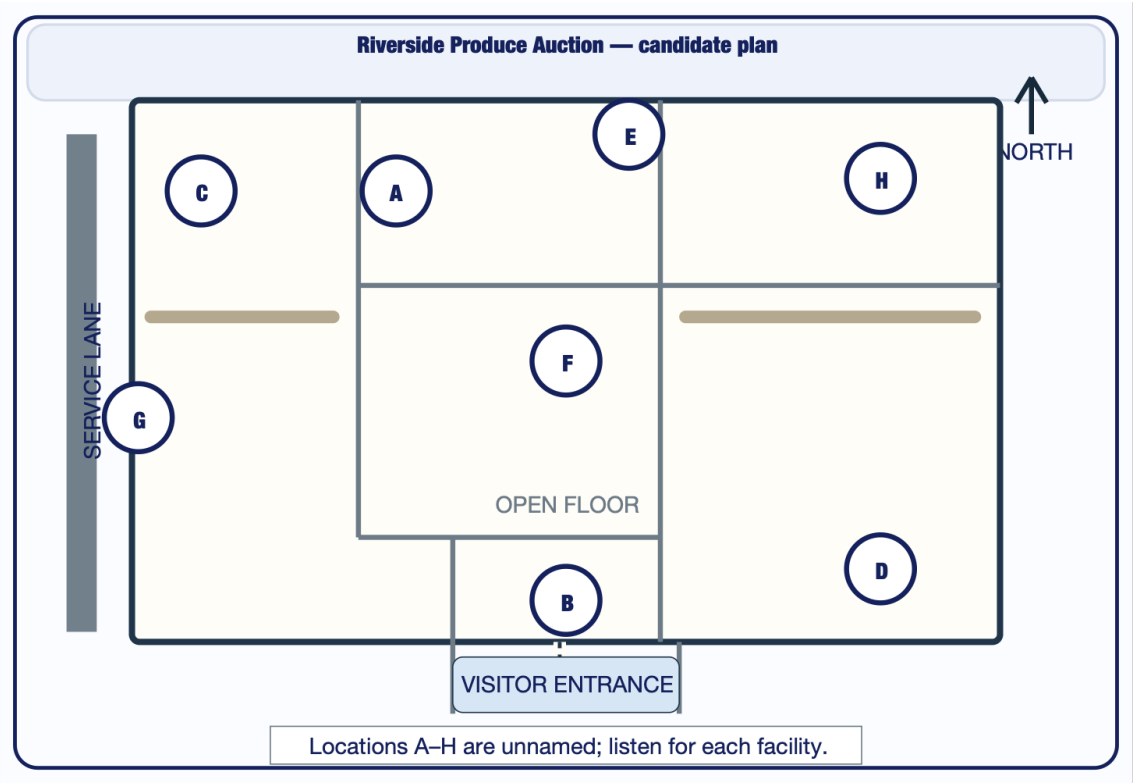

A when the driver arrives

B after condition inspection

C after the parcel is returned

Part 2

Candidate map / plan

Questions 11-16

Label the plan or map. Choose the correct letter.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

11. Public gallery

- **A** Location A
- **B** Location B
- **C** Location C
- **D** Location D
- **E** Location E
- **F** Location F
- **G** Location G
- **H** Location H

12. Bidding hall

13. Sample bench

14. Cold rooms

15. Wash point

16. Permit desk

Questions 17-20

Complete the notes. Write NO MORE THAN TWO WORDS for each answer.

17. Visitors first show their _____ at the entrance.

18. Only staff may cross the yellow _____.

19. The demonstration uses a small _____.

20. Purchased boxes are collected from the _____.

Part 3

Questions 21-25

Complete the sentences. Write NO MORE THAN TWO WORDS for each answer.

21. The test route will begin at the _____.

22. Each sign will use the same _____.

23. Participants will stand at a fixed _____.

24. The main outcome will be _____.

25. A wrong turn will be recorded as a _____.

Questions 26-30

Choose the correct letter, A, B or C.

26. Why do they reject testing three sign heights?

- **A** the corridor ceiling is too low
- **B** it would add another changing variable
- **C** participants would notice the purpose

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

27. How will letter spacing be varied?

A in three predefined levels

B according to each participant

C only on directional arrows

28. Who will take part in the pilot?

A first-year design students

B regular library users

C staff unfamiliar with the building

29. What will the camera record?

A faces during decision making

B movement at the choice point

C the wording read aloud

30. What will Merrick prepare next?

A the final statistical model

B the participant consent form

C the randomised sign sequence

Part 4

Questions 31-35

Complete the sentences. Write NO MORE THAN TWO WORDS for each answer.

31. Sound begins when grains move down the _____.

32. The grains tend to occupy a narrow range of _____.

33. The sustained tone has a relatively _____ frequency.

34. Too much _____ can prevent the sound.

35. A proposed explanation involves a _____ beneath the surface.

Questions 36-40

Complete the notes. Write NO MORE THAN TWO WORDS for each answer.

36. Field team first records the slope _____.

37. A microphone measures sound _____.

38. Samples are tested for grain size and _____.

39. Sensors beneath the surface detect _____.

40. Competing models are compared with field _____.

Reading

Answer all 40 questions. Follow the word limit shown for each completion task.

A tune inside a cylinder

A Before sound could be recorded and replayed electrically, instrument makers searched for ways to make music repeatable without a performer. Early mechanical devices were costly curiosities, combining metalwork, clockmaking and decoration. The pinned-cylinder music box emerged from that craft tradition. It did not preserve the sound of an orchestra; instead, it encoded a short sequence of notes as physical instructions. Its appeal came from the surprise of hearing an apparently self-contained object perform a recognisable tune.

B The listener first supplied energy by turning a winding key. This tightened a spring inside a barrel. When released, the spring drove a train of gears, but it could not be allowed to unwind at once. A governor moderated the speed so that the tune did not rush and then stop. These components were related to clockwork, yet musical performance demanded particular steadiness: a small variation in rotation altered rhythm even when every note remained in the correct position.

C The melody was carried by a pinned cylinder. As the cylinder rotated, individual pins lifted tuned teeth in a metal comb and then released them, producing notes. Pin arrangement determined order and timing, while each tooth’s physical properties helped determine pitch. The mechanism therefore joined a programme and an instrument in one assembly. Changing the tune was not like replacing a paper score; in many boxes, it meant changing the cylinder or owning a different machine.

D A comb might look like a single piece of metal, but its teeth had to respond as distinct musical elements. Makers adjusted them carefully, sometimes adding mass to lower a note or removing material to raise it. The process required judgement because tuning one tooth could affect the character of the whole instrument. A bright, clear sound depended on more than accurate pitch: the mounting, case and vibration of the comb also shaped what the listener heard.

E Manufacture changed as demand widened. Specialised tools allowed parts to be produced more consistently, and workshops divided tasks that one craftsperson might once have combined. Standardisation lowered the skill needed at some stages but did not remove finishing and adjustment. Decorative cases also ranged from plain to elaborate, permitting similar mechanisms to reach different markets. The music box thus became both a manufactured product and a display of taste, with price determined by workmanship, repertoire and appearance.

F Designers sought ways to offer multiple tunes without making the object unmanageably large. Some cylinders shifted sideways after one revolution so a different row of pins met the comb. Other mechanisms used replaceable cylinders, trading compactness for choice. Each solution imposed limits: additional pin paths demanded precision, while removable parts needed careful alignment. The apparent abundance of music was therefore produced by engineering compromise rather than unlimited storage.

G Later technologies could store longer performances and reproduce the sound of real musicians. Yet the cylinder box remains instructive because its programme is visible. A viewer can watch rotation become timing and see metal projections become musical events. For historians, it reveals how entertainment, precision manufacture and domestic consumption intersected. For engineers, it is a compact example of information expressed through shape. Its historical interest survives even when its original practical advantage has disappeared.

H The social meaning of the music box also changed with scale. A commissioned object displayed wealth and craft, whereas a cheaper box brought repeatable music into ordinary domestic routines. Repetition could be comforting, irritating or useful for teaching a familiar tune. Unlike a public performance, the mechanism played on demand and required no negotiation with a musician, yet its short repertoire made the owner's choices highly visible. This mixture of control and limitation helps explain the object's appeal. It offered private access to music while continually revealing the boundaries of mechanical storage. The listener owned the occasion, not an unlimited library. Repair added another layer of ownership. Dust, hardened lubricant or a bent pin could turn a familiar melody into hesitation or silence. A local repairer needed to recognise which fault belonged to the drive and which belonged to the musical programme. Owners sometimes tolerated a damaged note because intervention risked harming an irreplaceable cylinder. The instrument therefore accumulated a personal history: wear altered its voice, and maintenance decisions preserved some features while changing others. A

surviving box is not merely an example of its original design; it is evidence of repeated listening, handling and care.

Holding matter with sound

A Sound is usually treated as information, but an acoustic field also carries energy and can exert force. Under suitable conditions, that force can counter gravity on a very small object. The result is acoustic levitation: contactless suspension rather than a trick in which the object has no support at all. The support is supplied by pressure variations in the sound field. Because the object avoids a solid holder, researchers are interested in handling droplets or delicate samples that might be contaminated, distorted or absorbed by a surface.

B The simplest arrangements create a standing wave between an emitter and a reflecting surface. At particular positions, the forces can balance and form a stable trap. This geometry is conceptually clear, but the reflector restricts access and the trap positions are largely fixed by the wavelength. A droplet that grows or changes shape may respond differently. The method is therefore useful for demonstrating the principle and studying stationary samples, but less suited to complex paths.

C A phased array replaces one emitter with many controllable elements. By changing the relative timing of their signals, the system can reshape the field and move a pressure trap without physically moving the whole apparatus. This flexibility permits steering, although control becomes computationally demanding. The array must account for interactions between sound, object and surroundings. A command that moves one sample smoothly may destabilise another with a different size or density.

D Open-loop control assumes that the object follows the predicted path. Feedback control checks that assumption. A camera tracks the object, software compares its actual and intended positions, and the emitters are adjusted. This can correct small disturbances, but the measurement introduces delay. If correction arrives too late, an aggressive response may amplify the error. The design challenge is therefore not merely detecting motion; it is making a timely adjustment that restores stability without creating oscillation.

E Another approach modifies the space around the acoustic field. A shaped chamber can guide or concentrate pressure while reducing the number of independently controlled emitters. It may offer efficient suspension for a narrow class of tasks, but it sacrifices some freedom of access and movement. This illustrates a recurring trade-off: hardware geometry can perform part of the control work, whereas a more open arrangement transfers that burden to sensing and computation.

F Contactless handling does not make the sample passive. A liquid droplet may evaporate, changing mass and size while it is suspended. Acoustic energy can also affect internal circulation or surface shape. Researchers must therefore distinguish the behaviour they wish to observe from behaviour caused by the holding method. A non-contact technique removes contamination from a clamp or dish, yet introduces its own environment. “Contactless” should not be read as “influence-free”.

G Practical systems need a control margin: enough reserve force to tolerate modest disturbance without damaging the sample or requiring extreme sound levels. They also need verification, because a stable demonstration does not prove reliable transfer over repeated cycles. The best architecture depends on the task. A stationary measurement may favour a simple standing wave; an irregular route may justify an array and feedback; a high-throughput operation may prefer constrained geometry. Acoustic levitation is therefore a family of design choices, not a single universal device.

H Handling several objects introduces problems that are absent from a single-sample demonstration. Traps may interact, and moving one object can disturb another. Control software must decide whether to optimise every path simultaneously or sequence movements to preserve a wider safety margin. Verification also becomes harder because a successful average can conceal occasional loss of a fragile sample. For this reason, researchers distinguish proof of principle from an operational protocol. The former shows that force can be generated; the latter specifies repeatability, allowable sample variation and recovery when a trap fails. That distinction is central to responsible claims about practical application. Reporting should include failures as well as the smoothest demonstration. A video of one successful transfer cannot reveal how often a sample escaped, how long recalibration took or which objects were excluded before filming. Repeated trials and clear eligibility ranges turn spectacle into evidence.

A fair chance when there are too few places

A When a programme has fewer places than qualified applicants, selection cannot be solved by checking eligibility alone. Every remaining candidate may satisfy the threshold, yet some rule must still decide who enters. A lottery makes chance explicit. Critics see this as surrendering judgement; supporters argue that it can be more honest than pretending to measure tiny differences precisely. Its legitimacy depends on the stage at which it is used. Random admission before basic screening raises a different issue from random selection among candidates already judged suitable.

B First-come, first-served allocation appears neutral because everyone faces the same clock. In practice, it rewards access to time, information and reliable technology. People who learn about an opportunity late, work during registration hours or have unstable internet begin at a disadvantage unrelated to the programme's purpose. A queue can still be appropriate when early action is itself relevant, but convenience should not be mistaken for fairness. The central question is whether speed of application is a quality the institution intends to reward.

C Merit ranking seems to offer the opposite virtue: places go to those judged strongest. The difficulty comes near the cut-off, where small score differences may reflect measurement noise, unequal preparation or subjective assessment. A detailed rank can project false precision. This does not invalidate evaluation. It suggests that a threshold followed by a lottery may be preferable when the institution can distinguish acceptable from unacceptable candidates more confidently than it can order every acceptable candidate.

D Lottery design ranges from a complete draw to a tie-breaker used only among equally ranked candidates. Weighted lotteries give additional chances to groups or applicants with specified characteristics. Weighting can pursue access goals while preserving uncertainty, but it also makes the system harder to explain. If weights are poorly justified, randomisation may conceal rather than resolve disagreement. A draw is therefore not automatically fair; its rules encode values about who enters the pool and whether all entries count alike.

E Trust depends on a published procedure. Applicants should know eligibility rules, the number of available places, whether priority categories exist and how the draw will be checked. Releasing only the final names is insufficient because observers cannot distinguish an honest random process from an arbitrary decision. Independent verification can protect both winners and administrators. Transparency does not remove disappointment, but it changes the basis on which the outcome can be challenged.

F A lottery also changes what evaluation can reveal. Because selection among eligible candidates is random, later differences between selected and unselected groups may help researchers study programme effects, provided ethical and methodological conditions are met. Yet evaluation should not become the primary justification for denying a place. The allocation rule must first be defensible to applicants. A post-allocation review should also test whether eligibility and weighting created unintended exclusion.

G No allocation method is universally fair. Queues privilege prompt access, rankings privilege chosen measures, and lotteries privilege an equal or deliberately weighted chance. The appropriate rule follows from institutional purpose and from the kinds of error decision-makers are willing to accept. Where differences in merit are substantial and reliably measured, ranking has a strong claim. Where acceptable candidates are numerous and finely ranked differences are doubtful, randomisation may acknowledge uncertainty more honestly.

H The strongest case is for bounded randomisation: judgement defines a defensible pool, and chance resolves scarcity inside it. This model neither eliminates expertise nor treats applicants as identical. It asks experts to make the distinction they can support, then prevents them from inventing confidence beyond that point. Such restraint may feel less decisive than a complete ranking, but decisiveness is not the same as accuracy. A legitimate lottery is not an escape from reasons; it is a rule for acting when reasons run out.

I In every allocation round, applicants judge an allocation system not only by their personal outcome but also by whether the procedure treats them with dignity. A transparent draw can still feel dismissive if the institution offers no explanation or appeal for an eligibility error. Conversely, a carefully communicated lottery may be accepted even by people who lose, because the remaining scarcity is acknowledged openly. Communication cannot rescue an unjust pool, but it can expose mistakes before randomisation and clarify what chance did and did not decide. Procedural dignity therefore adds another requirement: people must be able to understand the rule and correct factual errors that wrongly exclude them.

1. Choose the correct heading for paragraph A.

i A melody stored as physical instructions

ii An old mechanism with continuing explanatory value

iii The transition towards broader manufacture

iv Music without a live performer

v Engineering solutions for a wider repertoire

vi Precision behind the sound

vii Controlling stored mechanical energy

viii Competition from public concerts

ix The disappearance of decorative cases

2. Choose the correct heading for paragraph B.

i A melody stored as physical instructions

ii An old mechanism with continuing explanatory value

iii The transition towards broader manufacture

iv Music without a live performer

v Engineering solutions for a wider repertoire

vi Precision behind the sound

vii Controlling stored mechanical energy

viii Competition from public concerts

ix The disappearance of decorative cases

3. Choose the correct heading for paragraph C.

i A melody stored as physical instructions

ii An old mechanism with continuing explanatory value

iii The transition towards broader manufacture

iv Music without a live performer

7. Choose the correct heading for paragraph G.

i A melody stored as physical instructions

ii An old mechanism with continuing explanatory value

iii The transition towards broader manufacture

iv Music without a live performer

v Engineering solutions for a wider repertoire

vi Precision behind the sound

vii Controlling stored mechanical energy

viii Competition from public concerts

ix The disappearance of decorative cases

8. What did the listener turn to store energy in the mechanism?

9. Which device controlled the speed of the gears?

10. What component carried the physical sequence of the tune?

11. What did the pins lift to produce notes?

12. What helped manufacturers make parts more consistent?

13. What could be replaced in some boxes to change the music?

14. creates stable positions between an emitter and a reflector

A standing-wave arrangement

B phased array

C feedback control

D shaped chamber

15. moves traps by altering the timing of multiple emitters

A standing-wave arrangement

B phased array

C feedback control

D shaped chamber

16. uses observations of actual position to correct motion

A standing-wave arrangement

B phased array

C feedback control

D shaped chamber

17. places some of the control function in the surrounding geometry

A standing-wave arrangement

B phased array

C feedback control

D shaped chamber

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

18. offers limited access because a reflecting surface is required

A standing-wave arrangement

B phased array

C feedback control

D shaped chamber

19. may need considerable computation when samples differ

A standing-wave arrangement

B phased array

C feedback control

D shaped chamber

20. can become unstable if its correction is delayed

A standing-wave arrangement

B phased array

C feedback control

D shaped chamber

21. Acoustic levitation supports an object through _____.

22. In a standing-wave device, trap positions are linked to the _____.

23. A phased array can steer a trap without moving the entire _____.

24. A _____ records the object's actual position.

25. A suspended droplet may _____ and lose mass.

26. Reliable operation requires reserve force, described as a _____.

27. The author believes a lottery should always be used before candidates are screened.

YES

NO

NOT GIVEN

28. A queue may favour applicants who have more flexible time and better information.

YES

NO

NOT GIVEN

29. The author considers all merit-based evaluation worthless.

YES

NO

NOT GIVEN

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

30. Weighted lotteries can pursue access goals but may be difficult to explain.

YES

NO

NOT GIVEN

31. The passage specifies that every draw must be supervised by a judge.

YES

NO

NOT GIVEN

32. The author says research value should be the main reason for withholding a place.

YES

NO

NOT GIVEN

33. The preferred allocation method should reflect the institution's purpose.

YES

NO

NOT GIVEN

34. Why does the author distinguish between lotteries used before and after screening?

A To show that screening is always inexpensive

B Because the stage of randomisation changes its fairness implications

C Because early lotteries require no rules

D To recommend that every applicant receive a place

35. What criticism is made of first-come, first-served allocation?

A It is impossible to operate online

B It rewards academic achievement

C It can reward advantages unrelated to the programme

D It always takes too long

36. When might a threshold followed by a lottery be appropriate?

A When acceptable candidates can be identified more reliably than finely ranked

B When no eligibility standard exists

C When evaluators agree on every score difference

D When places are unlimited

37. What is the main point about weighted lotteries?

A They eliminate value judgements

B They make all chances equal

C They are identical to queues

D Their weights need a defensible rationale

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

38. Why should procedures be published before the draw?

A So the process can be distinguished from arbitrary selection

B So applicants can predict the winning names

C So there is no disappointment

D So eligibility can be abandoned

39. What does the author mean by saying each method “privileges” something?

A Each method is legally protected

B Each rewards a different quality or condition

C Each produces identical outcomes

D Each benefits administrators only

40. Which best summarises bounded randomisation?

A Chance replaces every expert judgement

B Applicants choose their own odds

C Expert judgement defines the pool and chance resolves the remaining scarcity

D A ranking is disguised as a draw

Writing

IELTS Academic Practice Set 34 - Writing

1

You should spend about 20 minutes on this task.

The table below shows germination and twelve-week survival of five fictional native plant species under three pre-sowing treatments.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

Germination and twelve-week survival

Five fictional native plant species • percentage of seeds in each treatment batch

Species	Untreated		Smoke water		Cold stratification	
	Germ.	Survival	Germ.	Survival	Germ.	Survival
silver tussock	42%	31%	71%	59%	57%	48%
river daisy	58%	44%	63%	51%	76%	62%
sand heath	36%	29%	55%	46%	61%	53%
blue flax	64%	51%	68%	56%	81%	69%
marsh pea	47%	38%	52%	43%	70%	58%

Each pair shows germination first, followed by twelve-week survival.

Source: author-created fictional plant data

WeLearn Original Practice

2

You should spend about 40 minutes on this task.

Some people think that city authorities should charge owners when shops or offices remain unused for long periods.

To what extent do you agree or disagree?

Give reasons for your answer and include any relevant examples from your own knowledge or experience.

Write at least 250 words.

Speaking

IELTS Speaking Practice Set 34

Part 1

- Good morning. My name is the examiner for this unofficial practice attempt.
- What name would you like me to use?
- Thank you.

benches and places to sit

- Are there many places to sit in public areas near your home?
- When do you usually use a public bench?
- What makes outdoor seating comfortable?
- What improvements would you like to see in local seating areas?

package labels

- How often do you read labels on packages?
- Which information on a label is most useful to you?
- Do you find small print on labels difficult to read?
- Has a package label ever changed what you decided to buy?

fruit

- What fruit do you eat most often?
- Do you prefer different fruits in different seasons?
- Do you usually buy fresh fruit or prepared fruit?
- Have your tastes in fruit changed since you were younger?

Part 2

Describe a well-organised event that you attended.

You should say:

- what the event was and why it was held
- how it was organised
- what the participants experienced

and explain why you thought the organisation was effective.

- Would you like to have a similar experience again?
- Do you think other people would feel the same way?

Part 3

planning events for diverse audiences

- What are the main features of a successfully organised event?

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

- How should organisers balance accessibility with a limited budget?
- Why is it difficult to plan an event for people with very different needs?
- Who should be responsible for safety and crowd management?
- How much involvement should public authorities have in large events?
- How might technology change the way events are planned in the future?
