IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 38

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

You will hear four recordings. Each recording is played once.

Answer Questions 1-40. Follow the instruction and word limit printed for each group.

At the end, check your answers before submitting.

Part 1

Questions 1-6

Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

1. Customer surname: _____

2. Type of book: family _____

3. Main structural damage: loose _____

4. Chosen covering material: green _____

5. Title finish: _____ lettering

6. Collection date: _____ April

Questions 7-10

Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

7. Which existing feature should be retained?

8. What extra item does Calum recommend?

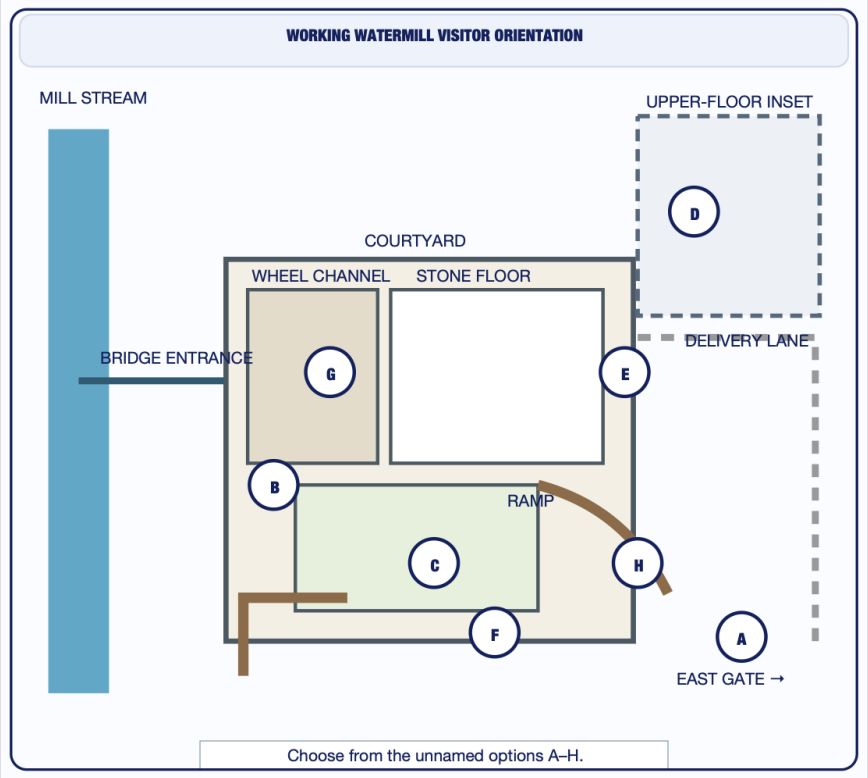

9. How long will the work take?

10. How will the book return to Leonie?

Part 2

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Candidate map / plan

Questions 11-16

Choose the correct answer.

11. Ticket desk

- **A** Location A
- **B** Location B
- **C** Location C
- **D** Location D
- **E** Location E
- **F** Location F
- **G** Location G
- **H** Location H

12. Wheel gallery

13. Flour room

14. Accessible viewing platform

15. Picnic lawn

16. Bread shop

Questions 17-20

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Choose the correct answer.

17. What must visitors do during a machinery demonstration?

A wear hearing protection

B stand beside the miller

C remain behind the rail

18. Where does the family trail begin?

A at the ticket desk

B in the flour room

C beside the picnic lawn

19. When is the main mill talk?

A 11.00

B 12.30

C 1.30

20. Which activity needs advance booking?

A the bread tasting

B the family trail

C the stone-dressing demonstration

Part 3

Questions 21-25

Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

21. Grip force will be recorded by a _____.

22. Each participant will test _____ prototypes.

23. The instructions should avoid the word _____.

24. A failed attempt ends after _____ seconds.

25. Prototype order will be _____ for each participant.

Questions 26-30

Choose the correct answer.

26. recruits older volunteers

A Soraya

B Ben

C Professor Kerr

D lab assistant

27. calibrates the force equipment

28. prepares illustrated instructions

29. codes opening errors

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

30. compares successful and failed attempts

Part 4

Questions 31-36

Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

31. The clouds form near the _____.

32. They consist mainly of tiny _____.

33. Ice develops around minute _____.

34. The upper atmosphere must be unusually _____.

35. Observers see the clouds during _____.

36. Displays often appear low above the _____ horizon.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Questions 37-40

Choose the correct answer.

37. Why can a low cloud not be noctilucent?

A it contains liquid droplets

B it would no longer receive sunlight

C it moves too quickly to photograph

38. What is one advantage of satellite observations?

A they identify every individual ice crystal

B they eliminate seasonal variation

C they cover areas with few observers

39. Why should long-term reports be interpreted cautiously?

A observation methods have changed

B the cloud altitude is unknown

C summer temperatures are constant

40. What does the lecturer recommend combining?

A winter and summer photographs only

B several independent types of evidence

C observations from one latitude

Reading

Read the three passages and answer Questions 1-40. Follow the word limit shown for each completion task.

A debt divided in two

A Long before cheap paper and searchable databases, administrators needed durable ways to record obligations. One answer was the tally stick: a piece of wood marked with notches that represented a payment, delivery or debt. The system did not depend on elaborate writing. What mattered was a convention linking the size and position of each notch to a quantity. Because the record was physical, it could survive handling that would damage a loose scrap of parchment, and it could be understood by people with limited literacy.

B After the notches were cut, the stick was split lengthways through them. One half, traditionally called the stock, went to one party; the other, the foil, went to the other party or remained with an office. The split produced irregular fibres along the break. When the halves were reunited, both the cut notches and the grain had to correspond. A later claimant could therefore present a record that was difficult to alter independently. The method turned one wooden object into two related witnesses.

C The cuts were not casual scratches. Their width, depth or shape distinguished values, while written names or dates could identify the transaction. A large notch might denote a larger unit and smaller cuts subdivisions, but conventions varied across institutions and periods. The stick worked only because users shared the code. It was therefore neither purely numerical nor purely material: a matching split could show that halves belonged together, but interpretation of the marks still relied on administrative practice.

D At settlement, officials placed stock and foil side by side. If the broken surfaces matched and the notches aligned, the pair supported the claim recorded at issuance. Cancellation could then be shown by cutting, piercing or otherwise marking the reunited pieces. This procedure separated two questions: whether the presented halves were originally one object, and what obligation their marks represented. The first depended on physical fit; the second depended on the accepted code and the surrounding account.

E Some tallies did more than acknowledge a completed payment. A government could issue a tally for money owed and the holder could transfer the claim to another person. In that setting, possession of one half represented an expectation of future payment. Yet the stick was not self-explanatory currency. Its value depended on confidence that the issuing authority would recognise the obligation and on clerks being able to reconcile it with records held elsewhere.

F Tallying persisted partly because it fitted existing routines. Wood was inexpensive, the split offered a practical authenticity check and established offices knew how to store and compare pieces. Replacing such a system required more than inventing a neater record. A reform had to provide equal confidence, train staff and make old obligations compatible with new accounts. Administrative technologies often survive because many procedures have grown around them, not because no superior material exists.

G As bookkeeping and paper records became more standardised, tallies lost their central role. Their disappearance is sometimes told as a simple victory of writing over a primitive device. That account misses their sophisticated division of evidence between parties. Modern systems likewise separate records and compare them later, although they use databases and cryptographic checks rather than matching wood grain. The useful historical lesson is not that wooden accounts were crude, but that trust is strengthened when no single holder can silently rewrite the whole record.

H For historians, surviving tallies are both informative and frustrating. Their physical form preserves notches and broken surfaces, but many lack the contextual papers that once explained a transaction. A stick detached from an account book may establish that a quantity was recorded without revealing why it was owed. Cataloguing therefore requires attention to inscriptions, dimensions and provenance. Digital photographs help access, although a flat image cannot fully capture how two irregular halves fit.

I The tally did not make fraud impossible. A corrupt office could issue false obligations, and a stolen half could be presented by the wrong person. Its achievement was narrower: altering one copy after division was likely to create a mismatch. That modest property is important. Reliable administration often grows from several limited checks placed

together - material fit, written identification, custody and reconciliation - rather than from a single device claimed to be unbreakable.

Cool refuges inside old trees

A A weather station reports conditions in open air, but a small animal experiences heat at the scale of a nest, a crevice or a patch of shade. During extreme weather, a difference of a few degrees between nearby microsites can determine how much energy an animal spends cooling itself. Tree hollows are one such refuge. Their walls block direct radiation and their enclosed air changes more slowly than the atmosphere outside. The benefit varies, however, with the hollow's shape, position and the size of the tree containing it.

B Many hollows begin with damage: a broken branch, fire scar or fungal decay opens a route into the wood. Expansion can take decades as decomposition removes material while living tissue continues to grow around the opening. Large old trees therefore contain a range of cavities rarely present in a young stand. When mature trees disappear, replacements cannot provide equivalent spaces immediately. Planting seedlings is valuable for the future, but it does not solve a present shortage of deep hollows.

C A cavity close to the ground is surrounded by a thick mass of wood and may receive less direct sun than an exposed branch hollow. In large trees, the interior can remain cooler than the surrounding air during the hottest part of a day. Studies of heat-stressed birds have recorded individuals using tree-base crevices and hollows as thermal refuges. This does not mean that every base cavity is safe: waterlogging, predators and restricted escape routes may make some unsuitable.

D A hollow can also slow air movement, reducing the rate at which moisture is carried away from an animal's body. For species vulnerable to dehydration, that sheltered boundary layer may matter as much as temperature. Yet a damp cavity can support parasites or fungi. The same feature may therefore be helpful during a short hot spell and harmful for prolonged occupation. Refuge quality has to be judged over time, rather than by taking one midday temperature reading.

E Managers facing a scarcity of natural cavities commonly consider three responses. Nest boxes can be installed quickly and placed where monitoring is convenient. Artificial hollows can be carved into living or dead trees, creating thicker walls than a box. A third approach is to protect existing hollow-bearing trees and the younger trees most likely to replace them. These measures operate on different timescales; treating them as interchangeable obscures both their strengths and their risks.

F A thin-walled nest box may heat rapidly when exposed to afternoon sun, even if its dimensions resemble a natural cavity. Orientation, colour, ventilation and surrounding shade all influence performance. Boxes can be useful for particular species, but simply increasing their number does not guarantee a network of drought refuges. Monitoring should record internal conditions and animal use, not only whether a box remains attached. Relocating a poor box can sometimes achieve more than adding another in the same exposed position.

G A cavity cut into a trunk can imitate some insulation provided by wood and can be designed with a narrow entrance. Its creation nevertheless wounds the tree and requires skilled assessment of structural safety. Evidence about long-term occupancy remains uneven because designs, climates and target species differ. A successful trial in one woodland is not a universal recipe. Managers need explicit criteria for evaluating use, overheating and tree health before adopting the technique at scale.

H Protecting large hollow-bearing trees preserves refuges already shaped by time, while retaining younger cohorts maintains continuity. This strategy can conflict with concerns about falling branches near roads or buildings. Risk management need not mean removing every old tree: access can be redirected, vulnerable limbs treated or habitat trees retained in lower-use areas. The strongest programme combines immediate aids with long-term retention. Manufactured shelters may bridge a gap, but only living landscapes can keep producing the varied cavities on which future animals will depend.

I A useful survey records more than the number of cavities. Entrance size, depth, orientation, internal temperature and distance to feeding habitat determine which animals can use them. Repeated observations are needed because an empty hollow on one visit may be occupied in another season. Mapping these properties reveals whether refuges form a connected network or a few isolated points. That information helps managers place temporary structures where they close a real gap rather than where installation is simply easiest.

Paying for the roof before it leaks

A Apartment owners often share responsibility for roofs, lifts, façades and drainage. None lasts indefinitely, yet a major repair can still be described as an unexpected expense when no money has been set aside. A maintenance reserve converts that foreseeable future cost into regular contributions. The principle is simple: residents who consume the building's service life should fund part of its renewal, rather than leaving the entire bill to whoever owns a unit when failure becomes visible.

B A credible reserve begins with an inventory of common assets, an estimate of their remaining lives and a forecast of replacement costs. Those figures are combined into a schedule showing when expenditure may occur. Precision is impossible - materials deteriorate unevenly and prices change - but a transparent range is more useful than false certainty. Updating the study after inspections allows contributions to respond to evidence instead of remaining fixed until a crisis.

C Regular contributions make costs easier for households to plan and allow a fund to earn interest. They also reduce dependence on emergency loans or sudden special levies. However, a perfectly level payment is not automatically fair. A lift may serve upper floors more directly, while the roof protects everyone. Allocation rules based on ownership shares, floor area or expected benefit produce different distributions. Fairness is a governance decision, not a number generated by an engineer.

D A reserve spreads payments through time, but apartments are bought and sold during that period. A seller may contribute for a roof that is replaced after departure; a recent buyer may benefit from years of earlier saving. Some regard this as unfair. Others reply that the sales price reflects the condition of the building and the strength of its fund. A well-disclosed reserve can therefore transfer value with the property, even though individual cash contributions and individual use never align perfectly.

E Requiring a reserve can prevent a majority from repeatedly postponing unpopular contributions. Yet a legal minimum may become a target rather than a floor. Buildings differ in age, exposure and equipment, so one percentage cannot represent every need. The writer's view is that regulation is most useful when it demands planning, disclosure and periodic review, while allowing the funding schedule to follow a building-specific study.

F A nominally healthy reserve may still fail if governance is weak. Boards can invest funds too aggressively, spend them on routine operating deficits or defer a repair to avoid criticism. Restricted accounts, dual authorisation and clear reporting reduce those risks. Owners also need reports that separate current operating costs from long-term capital obligations. Without that distinction, a temporary surplus can conceal the fact that major components are steadily approaching replacement.

G Too little saving produces deterioration and abrupt levies, but excessive accumulation also has costs. Money locked in a low-return account cannot be used by households for other priorities, and forecasts far into the future carry wide uncertainty. The aim should not be the largest possible balance. It should be a defensible probability that essential work can proceed when needed, supported by contingency ranges and access to limited borrowing for unusually early failures.

H Reserve policy is sometimes presented as a technical calculation, although it expresses a social contract between present and future owners. Reliable buildings require both money and consent to maintain them. A schedule that residents do not understand may be overturned at the next meeting; a popular low fee may simply transfer risk forward. Durable schemes connect inspection evidence, contribution rules and visible decisions. Their success is measured less by the size of the account on one date than by whether necessary work occurs without destabilising households.

I Prospective buyers need access to the reserve study, recent inspection reports and the history of contributions. A headline balance without the projected liabilities can be deceptive: a large account may be small beside an imminent façade repair. Standard disclosure lets buyers compare buildings and makes underfunding visible before a transaction. It also strengthens the connection between prudent saving and property value, rewarding current owners for decisions whose physical benefits may emerge after they leave.

J Completed work should feed back into the next forecast. Actual prices, delays and component condition reveal where earlier assumptions were weak. A roof that lasts longer than expected should not simply justify lower fees; it should prompt examination of why performance improved and whether that experience applies elsewhere. Reserve planning becomes credible when it is treated as an updating process rather than a document filed away after approval.

1. Paragraph A

i A code still needed shared knowledge

ii A modern lesson from an obsolete medium

iii A record suited to rough handling

iv A claim that could circulate

v Why every tally was legal tender

vi A split that created independent evidence

vii Persistence through institutional fit

viii Two checks at settlement

ix The failure of wooden records in damp climates

2. Paragraph B

i A code still needed shared knowledge

ii A modern lesson from an obsolete medium

iii A record suited to rough handling

iv A claim that could circulate

v Why every tally was legal tender

vi A split that created independent evidence

vii Persistence through institutional fit

viii Two checks at settlement

ix The failure of wooden records in damp climates

3. Paragraph C

i A code still needed shared knowledge

ii A modern lesson from an obsolete medium

iii A record suited to rough handling

iv A claim that could circulate

v Why every tally was legal tender

vi A split that created independent evidence

7. Paragraph G

i A code still needed shared knowledge

ii A modern lesson from an obsolete medium

iii A record suited to rough handling

iv A claim that could circulate

v Why every tally was legal tender

vi A split that created independent evidence

vii Persistence through institutional fit

viii Two checks at settlement

ix The failure of wooden records in damp climates

8. What material was used to make the record?

9. What was the foil's matching half traditionally called?

10. What natural feature had to correspond when halves were reunited?

11. What physical marks encoded the size of an obligation?

12. Who compared the two halves at settlement?

13. What later record material helped replace tallies?

14. Which feature is associated with large old trees?

A nest boxes

B carved hollows

C retention of natural hollows

15. Which response may overheat because its walls are thin?

A nest boxes

B carved hollows

C retention of natural hollows

16. Which response can be installed rapidly?

A nest boxes

B carved hollows

C retention of natural hollows

17. Which response may wound a living tree?

A nest boxes

B carved hollows

C retention of natural hollows

18. Which response maintains habitat already formed by time?

A nest boxes

B carved hollows

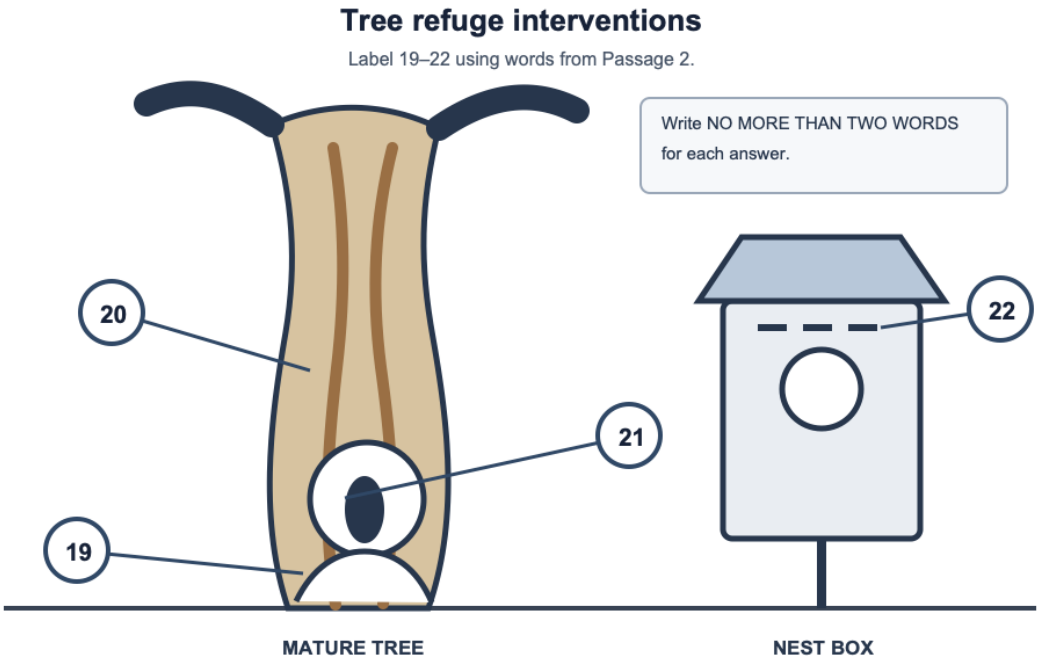

C retention of natural hollows

Questions 19-22

Label the diagram. Choose NO MORE THAN TWO WORDS from Passage 2 for each answer.

Diagram

19. Callout 19 identifies the _____ used as a refuge nearest ground level.

20. Callout 20 points to the thick _____ surrounding the hollow.

21. Callout 21 marks the narrow _____ of the carved hollow.

22. Callout 22 points to the nest box feature that lets air move through it.

23. Young planted trees can immediately replace all functions of old hollow-bearing trees.

TRUE

FALSE

NOT GIVEN

24. Every tree-base cavity is described as a safe refuge.

TRUE

FALSE

NOT GIVEN

25. The passage states that carved hollows are always occupied within one year.

TRUE

FALSE

NOT GIVEN

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

26. The recommended programme uses both immediate and long-term measures.

TRUE

FALSE

NOT GIVEN

27. A reserve should be treated as a response only to genuinely unforeseeable damage.

YES

NO

NOT GIVEN

28. Long-range cost forecasts can be perfectly precise if produced by an engineer.

YES

NO

NOT GIVEN

29. One allocation formula is inherently fair for every shared component.

YES

NO

NOT GIVEN

30. A strong reserve may be reflected in an apartment's sale value.

YES

NO

NOT GIVEN

31. Regulation should impose an identical contribution percentage on every building.

YES

NO

NOT GIVEN

32. A reserve study starts with an _____ of shared assets.

33. Periodic _____ allow the funding plan to incorporate new evidence.

34. Emergency borrowing can be reduced through regular _____.

35. Boards should distinguish capital needs from routine _____ costs.

36. A plan should provide a defensible _____ that essential work can proceed.

37. Why does the writer discuss owners who buy and sell?

A To argue that apartments should never change ownership

B To show that individual payments and benefits do not align exactly

C To recommend refunding every seller's past contributions

D To prove that sales prices ignore building condition

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

38. What danger is associated with legal minimum contributions?

A They ban building-specific studies.

B They make disclosure impossible.

C They may be treated as sufficient rather than minimal.

D They force all reserves into risky investments.

39. What is the writer’s view of the largest possible reserve balance?

A It is always the fairest objective.

B It should replace contingency planning.

C It removes all forecast uncertainty.

D It is not necessarily the right goal.

40. Which statement best summarises the writer’s conclusion about durable reserve schemes?

A They connect evidence, contribution rules and decisions that residents can understand.

B They are successful whenever the account reaches the largest possible balance.

C They make owner consent unnecessary once calculations are technically sound.

D They eliminate future repair risk by keeping monthly fees low.

Writing

IELTS Academic Practice Set 38 - Writing

60 minutes

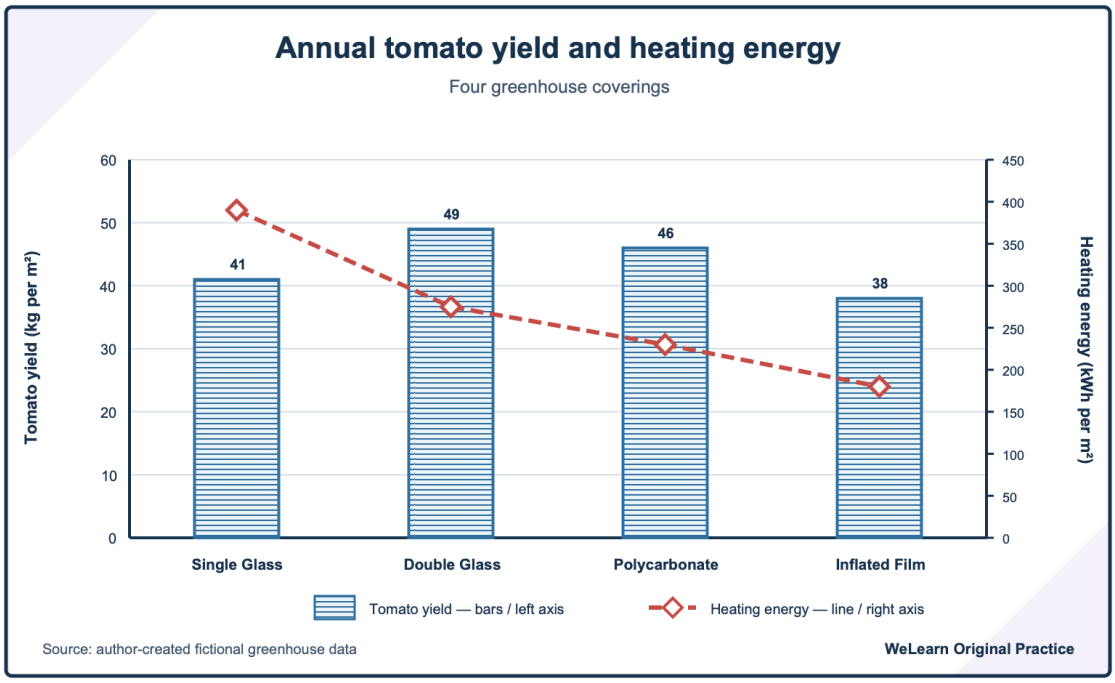

1

You should spend about 20 minutes on this task.

The visual below shows annual tomato yield and heating energy for four greenhouse coverings.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

2

You should spend about 40 minutes on this task.

Some people think that employees should be allowed to complete their weekly hours in four longer working days when their role permits. Others believe that a standard five-day schedule is preferable.

Discuss both views and give your own opinion.

Give reasons for your answer and include any relevant examples from your own knowledge or experience.

Write at least 250 words.

Speaking

IELTS Speaking Practice Set 38

Part 1

- Good morning. My name is James Carter.
- What is your full name?
- What should I call you?
- What kinds of things do you usually fasten together?
- Why might someone choose a paper clip instead of glue or tape?
- Which corridors do you use most often?
- What features of a corridor do you tend to notice?
- Which cooking smells do you enjoy most?
- Have your preferences for cooking smells changed over time?

Part 2

Describe a small business that serves its local area well.

You should say:

- what the business is and where it operates
- what service it provides
- what it does particularly well

and explain why it is valuable to the local area.

- Would you recommend this business to someone new to the area?
- Do you expect to use this business again?

Part 3

- Why can local ownership matter to a neighbourhood?
- How can small businesses compete with large chains and online platforms?
- Should public authorities provide special support for small businesses?
- How might neighbourhood businesses change over the next twenty years?
