IELTS ACADEMIC · STUDENT WORKSHEET

IELTS Academic Set 39

All sections

Name: _____ Date: _____

HOW TO USE THIS WORKSHEET

Work through each IELTS part in order. Reading passages stay with their questions; charts and diagrams appear next to their tasks. Open the live practice page for Listening audio and Speaking recordings.

Staff solutions and scripts are supplied separately.

Listening

Use the separately supplied audio. Write one response for each question.

You will hear four recordings. Each recording is played once.

Answer Questions 1-40. Follow the instruction and word limit printed for each group.

At the end, check your answers before submitting.

Part 1

Questions 1-6

Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

1. Customer surname: _____

2. Room: _____

3. Finished drop: _____ cm

4. New lining: _____

5. Existing fittings: silver _____

6. Collection: Friday the _____

Questions 7-10

Choose the correct answer.

7. Why are the curtains being shortened?

A the fabric has stretched

B the hem is damaged

C the new windows are lower

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com

Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

8. What will Owen check before fitting the lining?

A whether the fabric releases dye

B whether the hooks are valuable

C whether the curtains block all light

9. How many pairs will the driver collect?

A one pair

B two pairs

C four pairs

10. How will Niamh pay the balance?

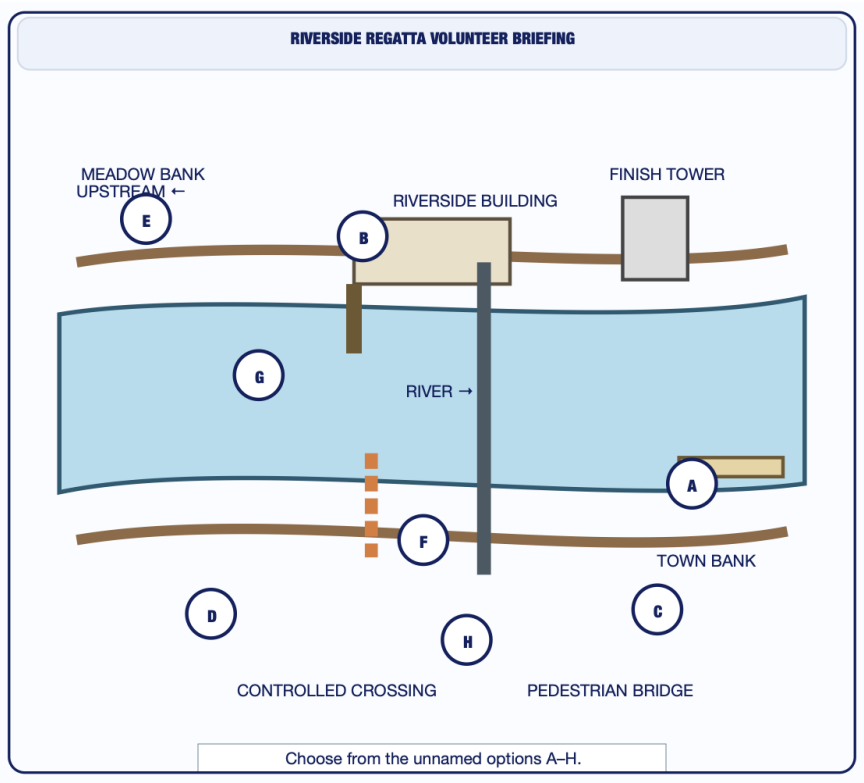

A by bank transfer

B in cash

C by card

Part 2

Candidate map / plan

Questions 11-16

Choose the correct answer.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

11. Registration tent

- **A** Location A
- **B** Location B
- **C** Location C
- **D** Location D
- **E** Location E
- **F** Location F
- **G** Location G
- **H** Location H

12. Boathouse

13. First-aid point

14. Commentary stand

15. Marshal post

16. Finish pontoon

Questions 17-20

Write NO MORE THAN TWO WORDS for each answer.

17. The pedestrian crossing opens only _____ races.

18. Volunteers must keep the _____ lane clear.

19. A lost child should be taken to the _____.

20. Radio messages should begin with the volunteer's _____.

Part 3

Questions 21-25

Choose the correct answer.

21. What weakness did the tutor identify in the first design?

- **A** two variables changed together
- **B** the lecture topic was too familiar
- **C** participants took no notes

22. Why will the team use unfamiliar lecture topics?

- **A** to make the recordings shorter
- **B** to encourage faster reading
- **C** to limit prior-knowledge effects

23. What will be rotated between participants?

- **A** the caption font
- **B** the order of the recordings
- **C** the room lighting

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

24. What outcome will supplement the comprehension test?

A note quality

B typing speed

C self-reported enjoyment

25. What does Dr Nair say about concentration ratings?

A they should be collected every minute

B they are more reliable than test scores

C they should not be used alone

Questions 26-30

Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

26. Participants: _____ students

27. Caption delay tested: _____ seconds

28. Listening equipment: closed-back _____

29. Notes collected on: _____

30. Final interview length: _____

Part 4

Questions 31-36

Write NO MORE THAN TWO WORDS AND/OR A NUMBER for each answer.

31. The leaf _____ slows water movement.

32. Meadows trap fine _____ carried from elsewhere.

33. Most long-term carbon is held in the _____.

34. Roots and _____ help stabilise the seabed.

35. Researchers take a sediment _____ to examine buried layers.

36. The age of deposits may be estimated with chemical _____.

© 2026 Idiomas WeLearn. Todos los derechos reservados. · idiomaswl.com
Uso personal y educativo. Prohibida su reproducción, venta o distribución sin autorización escrita.

Questions 37-40

Choose the correct answer.

37. carbon produced by seagrass

- **A** local plant material
- **B** restoration gain
- **C** imported terrestrial material
- **D** remobilised material

38. particles arriving from the catchment

39. carbon lost after a severe storm

40. additional storage after restoration

Reading

Read the three passages and answer Questions 1-40. Follow the word limit shown for each completion task.

The machine that swept the street

A Urban streets accumulated horse manure, mud, market waste and dust. Hand sweeping could move this mixture into heaps for collection, but the work was slow and exposed labourers to traffic and airborne dirt. Expanding towns wanted a machine that would gather material continuously while travelling. The challenge was not merely to rotate a brush. Debris had to be lifted from an uneven surface, retained rather than scattered, and deposited somewhere that could be emptied.

B Early mechanical sweepers were pulled by horses. Wheels drove a system of gears, which turned a cylindrical or diagonal brush as the vehicle moved. Setting the brush across the direction of travel pushed refuse towards a conveyor or collection body. Designers experimented with bristle stiffness and contact pressure: a brush held too high missed compacted dirt, while one forced down wore rapidly and threw dust beyond the machine's path.

C A powered brush alone can leave a clean strip beside a larger ridge of rubbish. Successful machines therefore coordinated sweeping with a receptacle. Some lifted debris mechanically; others directed it into a hopper behind the brush. The mouth of the collection system had to pass close to the road without striking raised stones. Patents repeatedly altered this junction between brush, roadway and container because it determined whether the machine collected dirt or simply redistributed it.

D Dry sweeping created clouds that annoyed pedestrians and reduced visibility. Water sprays were added to damp fine particles before the brush disturbed them. Too little water failed to control dust, whereas too much turned soil into a heavy slurry and increased the load. Operators learned to adjust spraying to weather and surface conditions. Dust control thus became an operational judgement as well as a mechanical feature, and water supply limited how long a sweeper could remain on its route.

E Motorised vehicles removed dependence on the movement of a horse-drawn wheel and allowed brushes, conveyors and suction systems to have their own power. Greater control did not eliminate trade-offs. A fast brush could clean aggressively but wear itself and damage loose surfaces. Suction captured lighter particles yet struggled with bulky objects unless paired with side brushes. Manufacturers combined mechanisms, placing rotating brushes at the kerb to feed material towards a central intake.

F Mechanisation reduced the amount of hand sweeping required along a route, but it did not remove workers from street cleaning. Drivers had to judge kerb distance, monitor water and clear blockages. Crews were still needed around parked vehicles, narrow alleys and obstacles. Maintenance shifted effort into workshops, where bristles, bearings and collection systems were repaired. The machine changed the composition of labour from repeated manual sweeping towards operation, support and specialised maintenance.

G Modern sweeping schedules balance cleanliness, pollution control, traffic and cost. A machine may pass frequently on a commercial street and rarely on a quiet road, even though both use the same equipment. Sensors can show when a hopper is full, but they cannot decide which neighbourhood receives priority. Street sweepers illustrate a wider point about municipal technology: successive patents improve components, while the public outcome still depends on routing, staffing and the definition of an acceptably clean street.

H Engineers evaluate a sweeper by spreading a measured mixture over a test surface and weighing what the machine recovers. Such trials allow designs to be compared, but a controlled strip cannot reproduce parked cars, broken kerbs or wet leaves. Field data are needed to connect laboratory efficiency with an operating route. Fuel use, brush replacement and missed patches all belong in that assessment; the percentage collected in one pass is only one dimension of performance. Repeated runs with worn bristles are particularly informative, since a machine purchased for impressive new-condition results will spend most of its service life somewhere below that peak.

I Fine road dust may contain tyre particles, soil and residues from combustion. Capturing it before rain can reduce material entering drains, yet sweeping can also lift particles into the air if brushes and sprays are poorly adjusted. Disposal matters too, since hopper contents cannot automatically be treated as clean soil. Effective programmes follow the material from

roadway to final handling instead of declaring success as soon as the pavement looks clear.

Living surfaces on old stone

A Lichens are partnerships in which a fungus lives with photosynthetic cells. They need no soil and can establish on exposed stone, making them conspicuous early colonists of roofs, walls and monuments. Attachment is slow, and a patch visible today may record many years of growth. That longevity interests ecologists, but conservators confront a different question: whether the organism is damaging the surface, merely occupying it or contributing to the valued appearance of an old structure.

B A monument is not a uniform habitat. Mineral composition affects acidity and nutrient availability, while grain size and porosity influence how long water remains after rain. Calcareous stone supports communities different from those on siliceous rock. Mortar joints add another substrate within the same wall. Consequently, a list of species from one face cannot be assumed to represent the entire building, and comparisons between monuments must account for their materials.

C North-facing surfaces in some climates remain moist longer, whereas exposed upper edges receive intense sun and rapid drying. Overhangs shelter stone from direct rain but may collect dust. These microclimates create bands and patches that can resemble a simple chronological succession. In reality, two adjacent areas may host different communities because they experience different wetting cycles. Spatial pattern is therefore not a clock unless exposure has been measured independently.

D Fungal filaments may enter pores and widen existing weaknesses as they expand and contract. Organic compounds can interact chemically with minerals, and fragments may detach when a crust is removed. These processes support concern about biodeterioration. Their practical importance varies with the lichen, stone and climate. On a sound block, change may be extremely slow; on a friable carved surface, even slight penetration can matter. A mechanism of damage is not by itself proof of serious loss at a particular monument.

E A lichen cover can also reduce direct exposure to wind-driven rain or rapid temperature change. Removing it may reveal a surface that is less stable than expected. Claims of protection must be treated as carefully as claims of damage, because a dense mat may trap moisture under other conditions. The relevant comparison is not a clean stone imagined as permanent, but the likely future of the actual surface with and without intervention.

F Mechanical scraping, chemicals and high-pressure water can remove organisms, but each method can also alter the substrate. If fragments remain, recolonisation may occur; if the surface becomes rougher, new attachment may even be easier. A visually uniform result immediately after treatment tells little about long-term conservation. Trial areas, magnified inspection and follow-up monitoring provide stronger evidence than cleaning an entire façade in one operation.

G Some communities regard lichens as neglect, especially where inscriptions become unreadable. Elsewhere, a weathered biological patina contributes to historical character. Ecologists may value rare communities that have developed on undisturbed stone. These positions are not resolved by laboratory measurements alone. Decisions have to identify which values - legibility, material preservation, appearance or biodiversity - are at stake and whether they can coexist on different parts of a monument.

H The evidence does not justify a rule that lichens should always be removed or always retained. Conservation begins with diagnosis: identify the organism, stone condition, exposure and purpose of the surface. An inscription actively losing detail may need targeted treatment; a stable patch away from carved features may be monitored. By replacing a binary argument with site-specific thresholds, managers can respond to genuine deterioration without erasing every living trace from historic stone.

I High-resolution photographs and mapped sample areas create a record against which later change can be judged. Colour alone is unreliable because a patch may darken when wet without expanding. Measurements should repeat under comparable conditions and include the stone immediately beyond the visible growth. A baseline is especially important when managers decide to monitor rather than clean: observation is an active policy only if a future team can recognise when the agreed threshold has been crossed.

J Laboratory studies can isolate mineral reactions, whereas a monument exposes organisms to fluctuating weather, pollution and repairs. Findings at one scale should inform, not dictate, decisions at another. A microscopic alteration may never produce visible loss, while a small weakness at a carved edge can have disproportionate cultural importance.

Conservation reasoning must connect mechanism, rate and significance instead of assuming that evidence of any interaction settles the case.

When an hour becomes a currency

A A time bank records services in hours. A member earns credit by helping someone and spends credit when another member helps them. One hour is normally valued as one hour regardless of whether the task is tutoring, gardening or companionship. Advocates argue that this rule recognises contributions undervalued in cash markets and invites people with limited money to exchange. The equality is moral and administrative; it does not mean that every task demands identical training or effort.

B Many schemes use a coordinator or digital platform rather than relying on two people to swap directly. A member can assist one person and later receive an unrelated service from someone else. This breaks the need for a coincidence of wants. It also creates work: requests must be matched, boundaries explained and inactive accounts followed up. The infrastructure supporting an apparently simple hour-for-hour exchange is substantial, even when much of it is volunteered.

C Newcomers often join because they need a practical service, while established members may be motivated by social contact or a wish to contribute. Organisations sometimes participate too, offering meeting space or staff time. These groups behave differently. Someone with urgent needs may spend before earning; a regular volunteer may accumulate credits they never use; an institution can dominate the ledger through its scale. A durable bank must accommodate those patterns without turning credit balances into measures of personal worth.

D Equal time is easy to defend for neighbourly assistance but harder where licensing, liability or expensive equipment is involved. A qualified electrician cannot necessarily provide regulated work through an informal exchange, and an hour using specialised machinery costs more than an hour of conversation. Some banks exclude high-risk services; others reimburse materials separately. The principle survives by narrowing what a credit promises. It measures time, not unrestricted access to every professional service.

E The system's social value may lie in generalised reciprocity. A member does not owe the original helper; the obligation is to the network. This can connect people who would never form a private barter pair. Yet trust weakens if members believe some repeatedly receive without contributing. Strictly blocking negative balances can exclude those with illness or caring responsibilities, precisely the people a community scheme may aim to support. Governance must decide when imbalance is exploitation and when it is solidarity.

F A count of exchanged hours shows activity but not outcome. A weekly visit may reduce isolation even if no concrete task is completed, while a large number of brief transactions may create little lasting connection. Evaluators therefore combine ledger data with interviews, retention and evidence of new relationships. The writer rejects the idea that rising transaction volume alone proves success. Measurement should follow the scheme's stated purpose, whether that is mutual aid, skills access or community participation.

G Time banks often become more stable when hosted by a library, health service or community centre. An anchor can supply rooms, safeguarding procedures and a coordinator. Dependence on one sponsor, however, makes the network vulnerable to a budget cut or a change of priorities. Diverse partnerships and member-led governance spread that risk. Institutional support is most useful when it provides continuity without converting the bank into a programme in which professionals deliver and residents merely receive.

H Time credits can reveal abilities ignored by conventional markets and create low-cost routes into participation. They cannot replace adequate public services or income. Treating volunteer hours as a substitute for trained care may transfer responsibility onto people with the fewest resources. The strongest claim is narrower: within clear limits and with dependable coordination, a time bank can build reciprocal relationships that neither cash purchase nor unstructured volunteering produces in quite the same way.

I Joining procedures shape who participates. Lengthy checks can deter casual offers of help, but no screening may expose vulnerable members to risk. Clear service descriptions, references for sensitive roles and a simple orientation provide a middle route. Schemes also need an exit policy for unused credits. If balances vanish without explanation, members may feel that earlier contributions were devalued; if they remain forever, the ledger becomes crowded with obligations the network cannot fulfil.

J Unsuccessful exchanges are valuable evidence when coordinators record why they collapsed. The obstacle may be travel distance, unclear expectations or a mismatch between requested and available times. Treating every failed match as personal unreliability hides design problems. Patterns can guide new meeting points, training or narrower promises. In this sense, administration does more than count hours: it translates repeated friction into changes that make future reciprocity more achievable.

1. Paragraph A

- **i** Independent power, continuing compromises
- **ii** Turning road wheels into brush movement
- **iii** A component improved within a political service
- **iv** Controlling airborne dirt with a limited resource
- **v** The collection challenge posed by urban waste
- **vi** Why suction completely displaced brushes
- **vii** Jobs transformed rather than erased
- **viii** The crucial hand-off from brush to container
- **ix** A machine needing no operator judgement

2. Paragraph B

- **i** Independent power, continuing compromises
- **ii** Turning road wheels into brush movement
- **iii** A component improved within a political service
- **iv** Controlling airborne dirt with a limited resource
- **v** The collection challenge posed by urban waste
- **vi** Why suction completely displaced brushes
- **vii** Jobs transformed rather than erased
- **viii** The crucial hand-off from brush to container
- **ix** A machine needing no operator judgement

3. Paragraph C

- **i** Independent power, continuing compromises
- **ii** Turning road wheels into brush movement
- **iii** A component improved within a political service
- **iv** Controlling airborne dirt with a limited resource
- **v** The collection challenge posed by urban waste
- **vi** Why suction completely displaced brushes
- **vii** Jobs transformed rather than erased
- **viii** The crucial hand-off from brush to container
- **ix** A machine needing no operator judgement

4. Paragraph D

i Independent power, continuing compromises

ii Turning road wheels into brush movement

iii A component improved within a political service

iv Controlling airborne dirt with a limited resource

v The collection challenge posed by urban waste

vi Why suction completely displaced brushes

vii Jobs transformed rather than erased

viii The crucial hand-off from brush to container

ix A machine needing no operator judgement

5. Paragraph E

i Independent power, continuing compromises

ii Turning road wheels into brush movement

iii A component improved within a political service

iv Controlling airborne dirt with a limited resource

v The collection challenge posed by urban waste

vi Why suction completely displaced brushes

vii Jobs transformed rather than erased

viii The crucial hand-off from brush to container

ix A machine needing no operator judgement

6. Paragraph F

i Independent power, continuing compromises

ii Turning road wheels into brush movement

iii A component improved within a political service

iv Controlling airborne dirt with a limited resource

v The collection challenge posed by urban waste

vi Why suction completely displaced brushes

vii Jobs transformed rather than erased

viii The crucial hand-off from brush to container

ix A machine needing no operator judgement

7. Paragraph G

i Independent power, continuing compromises

ii Turning road wheels into brush movement

iii A component improved within a political service

iv Controlling airborne dirt with a limited resource

v The collection challenge posed by urban waste

vi Why suction completely displaced brushes

vii Jobs transformed rather than erased

viii The crucial hand-off from brush to container

ix A machine needing no operator judgement

8. Hand sweepers first formed waste into _____ for collection.

9. On early machines, the _____ supplied motion to the gears.

10. The intake had to avoid raised _____ in the roadway.

11. Too much spray could produce a heavy _____.

12. Side brushes direct waste towards a central _____.

13. The three kinds of labour replacing repeated manual sweeping were operation, support and specialised _____.

14. Lichens require a layer of soil before they can colonise stone.

TRUE

FALSE

NOT GIVEN

15. All parts of one monument provide the same chemical habitat.

TRUE

FALSE

NOT GIVEN

16. A spatial pattern always gives a reliable measure of age.

TRUE

FALSE

NOT GIVEN

17. The presence of a damaging mechanism proves serious loss at any monument.

TRUE

FALSE

NOT GIVEN

18. Removing a lichen cover may expose an unstable surface.

F Paragraph F

G Paragraph G

H Paragraph H

I Paragraph I

J Paragraph J

27. Which participant is most likely to begin with an immediate practical need?

A a member currently needing support

B a regular volunteer

C a partner institution

28. Which participant may build a balance without spending it?

A a member currently needing support

B a regular volunteer

C a partner institution

29. Which participant can affect the ledger through its larger scale?

A a member currently needing support

B a regular volunteer

C a partner institution

30. Which participant may be unable to reply through contribution because of illness?

A a member currently needing support

B a regular volunteer

C a partner institution

31. Which participant can provide rooms and safeguarding procedures?

A a member currently needing support

B a regular volunteer

C a partner institution

32. Equal-hour accounting means every task has identical training requirements.

Writing

IELTS Academic Practice Set 39 - Writing

60 minutes

1

You should spend about 20 minutes on this task.

The table below shows the wingspan, mass, minimum steady wind speed and average stable-flight duration of four prototype kites in a fictional field trial.

Summarise the information by selecting and reporting the main features, and make comparisons where relevant.

Write at least 150 words.

Prototype kite performance

Fictional field trial

Kite model	Wingspan (cm)	Mass (g)	Minimum steady wind (km/h)	Average stable-flight duration (minutes)
Drift	150	320	12	28
Arc	120	260	10	24
Loop	95	180	8	19
Tower	135	410	15	31

Physical measurements and observed stable-flight duration are reported separately; no ranking is implied.

Source: author-created fictional field-trial data

WeLearn Original Practice

2

You should spend about 40 minutes on this task.

Some people believe that museums should present unresolved evidence and competing interpretations rather than one clear account.

To what extent do you agree or disagree?

Give reasons for your answer and include any relevant examples from your own knowledge or experience.

Write at least 250 words.

Speaking

IELTS Speaking Practice Set 39

Part 1

- Good morning. My name is Rachel Evans.
- What is your full name?
- What should I call you?
- Do you ever listen to local radio?
- Has the way you listen to radio changed in recent years?
- What kinds of entrances do you notice?
- Have you ever found an entrance difficult to use?
- When do you tend to notice moonlight?
- How is moonlight different in a city and in the countryside?

Part 2

Describe a public service that was more useful than you expected.

You should say:

- what the public service was
- how you discovered it
- how the service was used

and explain why it was more useful than expected.

- Would you use this public service again?
- Who else could benefit from this service?

Part 3

- How do people usually learn that a public service exists?
- Which groups are most affected when services move online?
- How can trusted community figures help people access services?
- How might people discover public services in the future?
